

# The AMATEUR<sup>3D</sup> PHOTOGRAPHER

& CINEMATOGRAPHER

~ The Journal for Everybody with a Camera ~

Vol. LXXX.

Wednesday, July 3rd, 1935.

No. 2434.

*Now - All together!*

... Capture those happy summer memories  
with the film which gives the finest results—

**SELOchrome**  
**EXTRA FAST**  
**ROLL FILM**

Made in England by ILFORD LIMITED, ILFORD, LONDON

“Wouldn’t  
it make a  
marvellous  
**MOVIE!**”

Every amateur photographer can make excellent movies. It's very easy with the Ciné-“Kodak.” And it's much cheaper than you might imagine. A roll of Ciné-Kodak Eight Film, for example, which costs 10/-, is sufficient for 20-30 different “shots.”

The first step—see Ciné-Kodak Movies for yourself. Any Ciné-Kodak Dealer or Kodak Branch will be pleased to show you.

# CINÉ-“KODAK”

**CINE-“KODAK” EIGHT** takes 25 ft. of 8 mm. film (equal in showing time to 100 ft. of 16 mm. film.) It costs £9 17s. 6d.; the complete outfit for taking and showing costs less than £20.

**CINE-“KODAK” 16 mm. CAMERAS** cost from £13 13s. upwards.

*All models available on hire purchase terms for small first payment*

KODAK LIMITED, KODAK HOUSE, KINGSWAY, LONDON, W.C. 2

PLEASE MENTION “THE AMATEUR PHOTOGRAPHER” WHEN CORRESPONDING WITH ADVERTISERS.

**a BRITISH MADE****EXPOSURE METER**  
for Still and Cine Cameras**CORRECT EXPOSURE  
EVERY TIME.**Obtainable at all High-class  
Photographic Stores*Enthusiastically acclaimed by Photographic Press.*

How can you be sure of correct exposure? You can be accurate every time, and with the utmost simplicity, now that a British manufacturer has produced a perfect exposure meter. The "AVO" Photo-electric Exposure Meter gives instantaneous indication of correct exposure, without the need for troublesome and time-wasting calculations.

Direct readings of shutter speeds and stop values are given over widest limits with a simple setting for film or plate speeds.

Exceptional sensitivity, variable to suit all conditions of light, gives extreme accuracy in weak light.

All extraneous light outside the picture angle is excluded from the light-sensitive cell.

Instantaneous indication assists best results in rapidly changing light.

Freedom from calculations and crowded tables is combined with absolute dependability and compactness for the pocket.

The **'AVO'**  
EXPOSURE METER

*Regd. Trade Mark*

**Simplifies  
and ENSURES  
CORRECT  
Exposures**

- A photo-electric meter with entirely unique sensitivity and accuracy.
- British Made and backed by the fame of "AVO" precision measuring instruments.
- Simplicity and rapidity of use. No calculations. No crowded tables.
- Universal—for "Still" or Cine cameras.
- Readings uninfluenced by sky or other extraneous light.
- Compact—light in weight. Size only  $3 \times 2\frac{1}{4} \times 1\frac{5}{16}$  inches.

**57/6**LEATHER CASE  
5/- EXTRA.

# CONTAX AND LEICA ENTHUSIASTS—BUYING, SELLING OR EXCHANGING—YOU CAN DEAL MORE ADVANTAGEOUSLY WITH THE ONLY FIRM IN GREAT BRITAIN SPECIALIZING EXCLUSIVELY IN MINIATURE PHOTOGRAPHY

With every camera we sell (new or second-hand) we give the following:

1. Pre-Sales Service. Including expert advice on the choice of suitable apparatus, and, where desired, comparative prints obtained with various well-known lenses at full aperture.
2. After-Sales Service. Including constructive criticism and advice on results and advance information of second-hand accessory bargains, etc.
3. Special consideration if at any time it is wished to dispose of the apparatus—either for cash or in part-exchange.

## A SELECTION FROM OUR LIST OF GUARANTEED SECOND-HAND MINIATURE CAMERAS.

### TEMPOPHOT

THE NEW CELL-METER FOR "STILL" AND CINE CAMERAS WITH AN AMAZING RANGE OF 2 MINUTES TO 1/3,000th SECOND.

No calculations whatever. Little bigger than a cigarette-case.

ONLY 75/- forocco slip-fastener case, 15/- extra.

### SALEX BALDA

16 pictures on 3 $\frac{1}{2}$ x2 $\frac{1}{2}$  roll film.

Metal body, D.V. finder, leather covering, nickel fittings. As illustrated, but with f/2.9 Meyer lens, delayed action Compur sector shutter, 1 to 1/300th sec. £9:5:0

Nine monthly payments of 21/8.

### ROLLEICORD

Has numerous special features in common with the famous Rolleiflex—One-lever Compur shutter, parallax compensation, patent film guide, Zeiss Triotar f/4.5 lens

£10 : 10 : 0

Nine monthly payments of 24/6.

### LEICA III

With f/2 Summar Lens.

Speeds from 1 to 1/500th sec. Distance measuring and lens focussing are done in a single action. Takes 12 or 36 pictures at a loading. £39:10:0

Nine monthly payments of 92/2.

With f/3.5 Elmar (as illustrated)..... £30:10:0

Nine monthly payments of 71/2.

### PAILLARD

9.5 and 16 mm. Cine Cameras.

Semi-automatic loading. Footage indicator. Semi-circular three-lens turret. Tri-focal view-finder. Speeds 8, 16, 24, 32, and 64 frames per sec. Still-picture device. Automatic rewind. Dallmeyer f/2.9 lens. £49

Nine monthly payments of 45 14s. 4d.

### CINÉ KODAK

You'll be sure of good results with this camera. The dearer model makes "Kodacolor" pictures.

With f/3.5 lens. £13 : 13 : 0

With f/1.9 lens. £18 : 18 : 0

Nine monthly payments of 31/11 or 44/2.

### 'IKOFLEX'

12 pictures on 8-exposure 3 $\frac{1}{2}$ x2 $\frac{1}{2}$  roll film. Full-size view-finder. Depth-of-focus scales. Large finder lens, quick and easy focussing. Novar f/4.5 lens and Ikoflex shutter. £7:15:0

Nine monthly payments of 18/-.

for transmission in the U.K.

VOL. LXXX. No. 2434.

ALTHOUGH the summer season is only just starting for the amateur photographer, preparations for the autumn exhibitions are already being made. The prospectus and entry form for both the Royal Photographic Society's Exhibition and the London Salon of Photography have now been issued, and we have a supply of each that we will be pleased to send to any reader on application. We note that the R.P.S. Exhibition is again to be held at 35, Russell Square, W.C.1, and is divided into four sections: (1) Pictorial Photography, (2) Colour Photography, (3) Natural History, Scientific and Technical, (4) Cinematography. Medals are offered in Sections (3) and (4), and several other awards are offered for special subjects. The sending-in day is Friday, August 16th. In the London Salon of Photography the conditions remain the same as in previous years—the entries being for pictorial work only. The latest date for receiving pictures at the Gallery, 5a, Pall Mall East, is Wednesday, September 4th. An article on the preparation of exhibition pictures is given in this issue.

### Vibrating Pictures.

That is a neat idea we find put forward in all seriousness in a scientific periodical, that from the point of view of optics the way to get a proper blending of superimposed colours in a picture would be to produce a slight rapid motion of the frame so that the retinal images would continually overlap. We can see the shocked faces of purists in the matter of art when, on entering a gallery, they observed that some modern impressionist works had been connected up with an electrical vibrator. The fan which

## TOPICS of the Week

### A WEATHER FORECAST FOR THE WEEK

By D. K. BARTLETT.

#### THURSDAY, JULY 4th.

Cloudy skies and dull weather generally can be expected. The out-of-door photographer may find this a disappointing day. The South-West of England will be the best area with better light periods.

#### FRIDAY, JULY 5th.

Brighter weather conditions will obtain in the Western areas. Fog and showers are probable at times in other districts. Not an ideal day for photography if prolonged bright weather is wanted.

#### SATURDAY, JULY 6th.

Brighter and clearer conditions are now due, and full advantage should be taken of this temporary improved spell. The Eastern and Western counties will offer the best opportunities for fine-weather photography.

#### SUNDAY, JULY 7th.

Unsettled, but the weather will afford possibilities for photography under a variety of light conditions.

#### MONDAY, JULY 8th.

Weather still variable, but affording many opportunities for the amateur photographer who cares to take advantage of changeable weather conditions for pictorial work. Weather in Scotland will now improve and become more settled.

#### TUESDAY, JULY 9th.

Thunder clouds and unsettled weather may occur in the South-West. The remainder of the country into Scotland will have brighter periods and clearer atmosphere.

#### WEDNESDAY, JULY 10th.

Local rainstorms are probable, and thunder in hilly areas. Cloud effects may be good, especially in the hilly centres. Bright weather at intervals.

ventilated the gallery might in some way also actuate the pictures which it was desirable should be viewed in this manner. It would be a sight to see the extreme examples, the last words in art, doing a tango, while the orthodox works remained static. It is said that the vibratory method helps to give the appearance of blending to colours which have been put on too crudely, with the superimposition too manifest. Whether the same thing might be followed with advantage in black and white, so that some strange creations we have seen became immediately intelligible on the application of electrical vibration, we do not know. Perhaps the proper thing to do would be to vibrate the observer—if he be not shocked enough already.

### Photographing the Lightning.

The old idea that lightning never strikes twice in the same place is effectively disposed of by a series of photographs before us as we write. They were taken at different times over a period of fifteen months, and they show thick, rich lightning flashes all striking the same point, namely, the top of one of the great skyscrapers in New York City. All the photographs were taken by a photographer from his own home about a mile away during various thunderstorms in the summers of 1933 and 1934. In every case there is a direct discharge to the mooring-mast on the top of the building which, incidentally, never suffered any injury. The building itself has been likened to a gigantic lightning rod extending almost a quarter of a mile into the air. Photographers interested in meteorological phenomena who are in the neighbourhood of high buildings during thunder-

storms might very well see whether that effect, only determinable, of course, by photography, can be reproduced.

### Photographs in the Library.

In the new "Library Year Book" only about half a dozen places are mentioned as having collections of photographs in the local public library. These are Birmingham, Coventry, Cardiff, Margate, Norwich, Watford and Worcester, as well as some of the London libraries. We can hardly think the list is complete, but certainly the collection and appropriate display of photographs in public libraries is far too often disregarded. With the

passing away of buildings and the changing of the landscape by means of what are sometimes wrongly called improvement schemes, photographs become of great historical interest and importance, and the subjects might be extended to include local celebrities. Many town council chambers are adorned with the portraits of successive mayors, but there are other characters who are often more picturesque and worthy of local record. The local photographic society might help.

### State Aid for Art.

The British Government furnishes by way of state aid to art the sum of £1,377,000 a year, or about one-

twelfth of what it spends on the Royal Air Force or one-tenth of what it receives from the Post Office. Of this expenditure more than half is represented by provision for technical institutes, schools, evening art centres, and the like. The next largest item is £290,000 for the British Museum, and after this, £62,000 for the preservation of historic buildings and ancient monuments. In view of the inspiration which our art has received from ancient Greece and Rome we may suppose that the £500 to the British School of Art at Rome and the similar amount to the British School of Art at Athens is a sort of token repayment.

## "The Amateur Photographer" EXPOSURE TABLE—July

EVERY MONTH a brief exposure table will be provided for the assistance of our readers in their practical work. A glance at the current approximate exposures as here given will serve as a reliable guide for most purposes. The subjects will be varied to suit the time of year. The following exposures will serve as a working guide for any fine day during the month, between the hours of 10 in the morning and 2 in the afternoon, with the sun shining, but not necessarily on the subject. Stop used, f/8. The exposure should be doubled if the sun is obscured, or if stop f/11 is used. For f/16 give four times the exposure. For f/5.6 give half. From 8 to 10 a.m. or from 2 to 4 p.m. double these exposures. From 6 to 8 a.m. or from 4 to 6 p.m., treble them. From 5 to 6 a.m. or 6 to 8 p.m., about four times these exposures will be required.

N.B.—The times given above are by "sun time." The exposures, therefore, which are laid down as suitable for 2 to 4 p.m., for instance, will be those to be given between 3 and 5 p.m., by the clock, during "summer time."

SUBJECT.	Ordinary.	Medium.	Rapid.	Extra Rapid.	Ultra Rapid.
Open seascapes and cloud studies .. ..	1/40 sec.	1/60 sec.	1/120 sec.	1/160 sec.	1/200 sec.
Open landscapes with no very heavy shadows in foreground, shipping studies or seascapes with rocks, beach scenes ..	1/25 "	1/40 "	1/75 "	1/100 "	1/125 "
Ordinary landscapes with not too much foliage, open river scenery, figure studies in the open, light buildings, wet street scenes	1/18 "	1/30 "	1/50 "	1/70 "	1/90 "
Landscapes in fog or mist, or with strong foreground, well-lighted street scenes ..	1/10 "	1/15 "	1/30 "	1/40 "	1/50 "
Buildings or trees occupying greater portion of pictures, river scenes with heavy foliage	1/2 "	1/12 "	1/25 "	1/30 "	1/40 "
Portraits or groups taken out of doors, not too much shut in by buildings .. ..	1/2 "	1/3 "	1/6 "	1/8 "	1/10 "
Portraits in well-lighted room, light surroundings, big window, white reflector ..	3 secs.	2 secs.	1 "	3/4 "	1/2 "

As a further guide we append a list of some of the best known makes of plates and films on the market. They have been divided into groups, which approximately indicate the speeds referred to above. The hypersensitive panchromatic plates and films require less exposure than the ultra-rapid.

Ultra Rapid.	Ordinary.	Medium.	Rapid.

# Preparing Exhibition Prints

This article is written for those who are contemplating submitting work to the selection committees of the major exhibitions of pictorial work. Hints are given as to the essentials in the matter of subjects and the preparation of the print.

IT is the ambition of most serious amateur photographers to see their work upon the walls of one or other of the more important exhibitions, where acceptance or rejection is the acid test of the quality of the work. The present is a good time to consider the exhibition print, and there is good reason for preparing the entry well in advance.

There are two courses open to the photographer. He may select the best of his negatives, and make the best possible prints, or he may decide to select a subject specially for the purpose.

Both have advantages. A good negative may have been made of a subject which cannot be repeated, and is in every way suited to the needs of the case. On the other hand, the photographer can choose a subject, and visualise in its final form the print to be submitted to the selecting committee. He can make varied attempts under different conditions during the summer months, until the right negative is secured, after which the rest is easy.

## The Subject.

A good subject is necessary, and the print must display originality on the part of the photographer. This does not mean that the subject must be one that has not been used before, but that the hackneyed theme must be presented in a different way. The actual difference between the work selected and that rejected is not in the matter of subject, but in the way in which the material has been handled.

It is possible to treat the most commonplace material in an original way, by the use of a different lighting effect or by taking the picture from a new angle, which does not necessarily imply that the picture must be of the "modern" type.

## The Print.

Having made the negative, which must be of irreproachable quality, the photographer has to consider the print. The modern printing

processes offer great scope for the photographer to exercise control over the result, and to emphasise any phase of the subject.

Apart from these the worker who prefers to keep to the "straight" path will find that by the use of the right grade of bromide paper of a surface and colour in harmony with the subject, he has a means of controlling the result to a far greater extent than may at first be imagined.

## Other Processes.

The would-be exhibitor will be well advised to use a process of which he is master rather than to attempt those which he does not understand. These may seem to offer possibilities, but they need practice before such properties can be used to the full advantage. If, however, the task is attempted in good time a new process may be tried.

Most exhibition prints in these days are made upon bromide or chloro-bromide paper, due to the fact that most photographers use small cameras and enlarge their negatives, and also because the range of modern papers will meet almost every photographic need.

In this connection it should be pointed out that the print must be of perfect quality. The selecting committees see so much good work that they will not consider favourably any which is indifferent. Their aim is the selection of the best pictorial work, but the latter is only obtainable by perfect technique. A perfect print is necessary. It is one that is rich in colour, with a suggestion of tone in the highest lights, and depth to the shadows.

## Size.

The size of the print should also have careful consideration. A good subject gains when presented upon a large scale, but size is not in itself a merit, and it is possible that enlargement beyond certain limits may make evident defects which escape notice in a print of smaller dimensions.

With regard to this matter whole-plate is the smallest size that may be recommended if the print is to stand any chance in competition with others. It is true that certain "gems" find their way to the exhibition walls, but these are the works of those who specialise in these fields.

The print for exhibition should be rather stronger than that intended for home decoration, for the reason that the lighting in the gallery is of greater power, and the print also has to stand competition with others.

## Trimming and Mounting.

This matter should also have more thought than it generally receives. Careful trimming will show the subject to the best advantage, while mounting will have the same effect. Mounts are required to be of standard sizes, and light in colour, but this does not mean that any white card will serve. Many otherwise excellent prints are spoiled by careless mounting. The mount should harmonise with the texture of the print, and the latter should be pasted flat, or dry mounted. This is not the most easy job, and the photographer may find it better to place his dry mounting in trade hands, as the rules of most exhibitions permit.

The amateur is advised to make his exhibition prints in good time, and to live with them before sending them in. It will probably be found that after a few days there will be less satisfaction, and possibly an improvement in one direction or another may be suggested which, if carried out, will improve matters.

Lastly, the photographer is recommended to read the rules at least twice, carefully. Many entries do not conform with the rules, and their fate may be imagined. The prints should be carefully packed, so that the judges will see the photographer's work at its best, and dispatched well in advance of the closing date.

# Using the Slow Speeds of a Shutter

By D. KIN.

ONE of the most useful lessons I learnt from *The Amateur Photographer* in my early studies was that of investing in a good shutter, so as to have the slow speeds available. When I ultimately bought a hand-stand camera I found myself frequently setting the speed dial to  $\frac{1}{2}$  or  $\frac{1}{5}$ th sec. with a filter on the lens and the tripod in use.

The introduction of miniature cameras and very fast films has created a great change in photography, for, although not dispensing with a plate camera and tripod, I find the small camera so handy on the many occasions when it is inconvenient to erect a stand camera, that it comes more and more into everyday use. But there seems to be no great change in my manner of using lens and shutter speeds.

In spite of a large-aperture lens and highly speeded shutter, I find the slow speeds just as much in demand as formerly, save that my camera is held steady by the cheekbone instead of a tripod. It seems to me to be a most necessary accomplishment for the efficient handling of a miniature, for such a manipulation will often make all the difference between a well-exposed and a doubtful negative.

*In Old Shrewsbury.*

*Godshill, I. of W.*

There is an increase in the depth of focus, as a lens of large aperture is used on a small-size negative, but there are times when it is safer to stop down, and situations when a full opening must be used as well as a slow shutter speed. "In Old Shrewsbury" is a typical example of this point, and represents just the kind of thing a touring

photographer loves to take in old-world towns.

As I arrived the two men were obviously nearing the end of checking the ornaments, and since they were essential to the picture, quick action was necessary. Nor was there time to work out an exposure and stop, so, to avoid any fuzzy brickwork, I set my camera at 15 ft. and  $f/8$ . Steadying myself as much as possible, I waited for a moment of no movement in the figures and gave an exposure of  $\frac{1}{2}$  sec.

At first glance it would appear that "Godshill, I. of W." is a perfectly simple snapshot at, perhaps,  $f/8$  and  $\frac{1}{25}$ th, but this is not the case. It had to be taken from such a position that a tripod was out of the question. I wanted the hedge in the foreground sharply focussed and I wished to use a filter. As it was a September afternoon a slow snapshot of  $f/11$  and  $\frac{1}{5}$ th sec. was decided upon and proved to be correct.

On dull days, particularly, the ability to use slow speeds out of doors adds greatly to one's chances of securing pictures, while ninety per cent of night snapshots, indoors or out, have still to be exposed at  $\frac{1}{2}$ ,  $\frac{1}{5}$ th, or  $\frac{1}{10}$ th second, so it will be realised that this is a knack well worth acquiring by all.

F/3.9 Novar anastigmat, 3-speed shutter, 1/25th, 1/50th, 1/100th sec., T. and B. **£6:12:6**  
Nine monthly payments of 13/9.

# Camera Movement during Exposure

By R. E. DICKINSON.

and its Effect in Miniature Camera Work

IF any camera can be called "universal," the miniature certainly has the best claim, but it must often occur to the thinking man that some of the sample pictures advertised so widely could be done as well with larger apparatus and with much greater ease. Done by the miniature they are "achievements," for it is by no means so simple to produce technically perfect enlargements from tiny miniature negatives as from negatives taken with a larger camera.

Apart from the question of grain and of the need for absolute freedom from dust and blemishes, there is always the possibility of camera movement. With a practised hand the camera will be held perfectly steady in any case. When, however, camera-shake is introduced at the moment of exposure, its effects are much more in evidence with a miniature than with a larger instrument. There are probably few who have figured out how the allowable movement compares with lenses of different focal length. The following diagrams will make the matter clear.

In Fig. 1 is shown a long-focus lens focussed on an object, the camera being slightly moved during exposure. Compared with Fig. 2, for a short-focus lens, it is evident that the length of subject "blurred" by camera movement is much greater in the second case, and the diagrams show that the "blur" is proportional inversely as the focal length of the lenses.

Now suppose we have two cameras, a miniature and a quarter-plate, and our problem is to produce an enlargement with an equal size image from both, with an equal degree of sharpness. Let us also assume that both cameras receive an equal amount of movement during exposure.

On the one hand, as just shown, the "blur" due to camera movement is greater in the miniature case, but, on the other hand, its standard  $f/3.5$  lens, compared with the standard  $f/4.5$  for the quarter-plate, reduces the exposure and so reduces the blur. Exposure is, of course, inversely as the square of the  $f$ /number, and for  $f/3.5$  is 0.6 times that of the  $f/4.5$ .

Again, on the debit side of the ledger, the miniature needs a greater degree of enlargement, and since the image size is proportional to focal length, the linear enlargement necessary is inversely as the focal length. So, of the three factors—camera movement, exposure and enlargement ratio, exposure is inversely as the square of aperture and the other two are inversely as focal length.

Expressed in simple figures, the loss of definition in the miniature is:

$$\left(\frac{3.5}{4.5}\right)^2 \times \left(\frac{F_2}{F_1}\right)^2$$

where  $f/2$  is the focal length of the quarter-plate, say 5 in., and  $f/1$  of the miniature, say 2 in. This expression works out to 3.75, which means that camera movement has 3.75 times as much effect in impairing definition, and this, too, assumes that enlarging is done as perfectly as possible, which, unless the worker or his D. & P. dealer uses precision enlargers, is certainly not always the case.

How does the "V.P." size fare in this comparison? Cameras which take 16 on  $3\frac{1}{4} \times 2\frac{1}{4}$  films are multiplying and can be bought at a reasonable price with  $f/3.5$  lenses of a focal length of 7.5 cm. or 3 in. Our ratio then becomes 1.67, which means that the difficulty from this source is reduced by more than half, a great improvement on the ciné-film size.

To my mind the need of the moment is for cameras taking 16 on standard 120 film (on account of its cheapness) with a built-in range-finder, and lens of at least  $f/3.5$  aperture. The user of such a camera will be much less troubled by the difficulty of holding it still, and he will have less bother with fine-grain problems and the need for meticulous care in handling than his ciné-film rival.

## Waterproofing a Miniature Camera

By C. R. SOUTHALL.

FINE pictorial effects occur during showery days and wet nights; furthermore the pageant, sports, motor race or other outdoor event which one particularly wishes to photograph frequently falls on a wet day! The wide aperture will permit snapshots under such conditions, but a miniature camera is bound to suffer, even if it is carefully dried, unless protected from the rain.

A small camera can be made rain-

proof by means of a piece of oiled silk. (About one square foot for a half-V.P. camera.) A hole is cut of slightly less diameter than the lens mount, and slits are cut for the D.V. finder. The hole is placed in register with the lens mount, and the material is clipped round the mount by a spring-clip lens hood (see illustration). The hole should not be cut in the centre, as more material is needed above it to pass over the right hand and the camera. The material must not fit tightly over Compur shutters, as the setting lever has to have free movement. All adjustments are carried out by the right hand, which is protected.

The oiled silk should be fitted carefully in a dry place. When not in use it can be folded, and does not take up any space. The addition of a properly "tailored" piece will make a miniature camera outfit even more versatile.

July 3rd, 1935

# With a CAM

A Fruitful Subject for the

By BERNARD ALFIERI, Jun.

*At Thames Ditton Regatta.*

SUNSHINE and laughter, a good wetting and a fine bag of "shots"—probably few subjects lend themselves to the amateur photographer and cinematographer so well as a regatta.

Of course, there are regattas *and* regattas. Most of us remember the sort of affair where an hour after the advertised starting-time a gun goes off,

and we learn when it is all over that the boats that passed a few minutes after were doing marvelous style; in fact, it was only the organisers and actual competitors who really knew that anything had happened at all.

*Racing Eights at Kingston Regatta.*

*Molesey Regatta at Hampton.*

But stylish events of this nature are happily too important to be held with impunity, and the word regatta embraces those popular gatherings on the river where they start by somebody falling in, and end with a firework display, possibly because people are having such a good time that they are unwilling to go home and there is not enough light to see anything else.

Such a function becomes a fruitful subject for the photographer, apart from an enjoyable excuse to get wet and make the most of a day in the

# ERA at the Amateur. REGATTA

fresh air. It is one of those subjects that will provide pictures for all and every type of camera; will offer difficult and exacting exposures for the serious worker, and happy snaps for the box camera.

From early June to late September there is an unending succession of such events, and, apart from a small fee to a ferry or the price of refreshments, it is a cheap form of

*Start of Skiff Race at Teddington Regatta.*

Reflections help in planning simple compositions, and it is often possible to take advantage of overhanging foliage during the placing of a picture; but it is well to bear in mind the composition of light and dark portions of the subject, which are just as important in picture-making as the correct spacing of figures or objects, and it is surprising how distracting large patches of either sun-reflecting water or dark shadows on the river can disturb and detract from the main theme of our subject. This kind of work calls into play all the photographer's powers of observation and craftsmanship.

*Sculling with Broomsticks.*

entertainment within the reach of all.

Particularly in sunshine, subjects with a watery setting tend to result in hard negatives with clogged highlights, so that it behoves the photographer to make the exposures with this in mind, and due to the reflected light it is very easy to over-expose. This is sometimes a safeguard against over-contrasty negatives, as, if they are slightly under-developed, it will ensure the full detail in the shadows and still produce sufficient density in the highlights.

Panchromatic plates or films are a great help, and on most river subjects a filter is not necessary, in fact on many subjects it would only tend to over-correction, except where autumn red and russet foliage must be taken into consideration.

*Riding the Hobby-horse at the Swan Regatta.*

# News and Reviews

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS

The Second Annual International Southern Counties Salon will be held in the Lounge of the Astoria Theatre, Brixton, from Sunday, August 11th to Saturday, August 31st. Entries should arrive not later than July 11th, addressed to the Hon. Salon Secretary, W. Bertram, 45, St. Lawrence Road, Brixton, S.W.9, who will be pleased to supply entry forms on application.

Several attractive photographic competitions are now running in the daily Press. The *Daily Sketch* is offering £1,000 for photographs of "Bathing Belles"; the *Daily Herald* is offering £2,500 for a snapshot; the *Daily Mail* is offering £15, £10 and £5 every week for snapshots, with £50 for the best in each of three sections at the close of the competition; the *Sunday Pictorial* offers £5 5s. and £3 3s., and other prizes every week for "happy snaps." Full particulars and conditions of these competitions will be found in the papers themselves.

We regret to have to record the death of Mr. Fred T. Usher, of the staff of Ilford, Ltd., and previously of the staff of Messrs. Wellington & Ward. He was well known as an expert bromoil worker, and his services as a lecturer and demonstrator of the oil processes were in great demand amongst the photographic societies.

A change of secretary has taken place at the Oldham Equitable Photographic Society, this position now being occupied by Mr. A. E. Petrie, 62, Littlebank Street, Oldham, to whom all communications should be addressed.

This is the time of year when countless motorists are planning their holidays and tours, often a difficult matter without expert assistance. To all such this

week's Special Summer Number of *The Autocar*—July 5th—will help materially to solve the problem. A photograph section depicting beauty-spots of Great Britain, how to cover the best of the Lakeland Hills in a day, what constitutes the ideal car, hints on summer touring, and all the sport in news and pictures, are among the features of a most attractive issue.

"The Motor Cycle," our vigorous associated journal, which enjoys the largest circulation of any motoring journal in the world, is issuing a remarkable Special Number this week, dated July 4th. In addition to an enlarged issue, giving all the news and views of two- and three-wheel motoring, a 32-pp. booklet of full paper size is presented with each copy. This booklet, profusely illustrated, is one of the most useful touring guides, in compressed form, to Great Britain. Every motorist, car driver, or motor cyclist, should not only secure a copy, but keep the booklet handy on his vehicle for use when away from home.

Mr. T. D. Nunn, Hon. General Secretary of the Woolwich Photographic Society, advises us of a change of address, which is now 33, Selwyn Crescent, Welling, Kent.

The Westminster Photographic Exchange of 62, Piccadilly inform us that they have also been appointed wholesale distributors of the "Avo" Photo-electric Cell Exposure Meter, to which several references have already been made in "The A.P."

The Exhibition of pictures taken with the Contax camera now open at the Gallery of Messrs. R. G. Lewis, at 202, High Holborn, W.C.1, consists mainly of entries by ordinary amateurs, and in

every case are "straight" enlargements. Fifty of the pictures are selected from entries to a competition. Two of the most striking exhibits are a 6x4 ft. enlargement from half a Contax negative, representing a magnification of over 4,900 times super, and a picture taken with f/1.5 Sonnar lens in ordinary theatre lighting at 1/500th sec. The exhibition will remain open until 13th July, admission being free.

The Zeiss Ikon general catalogue for 1935 has been published and contains full particulars of all the photographic apparatus and materials issued by this firm. This catalogue is supplied to dealers, but for free distribution they issue a twelve-page folder which contains a brief reference to a great number of the firm's specialities. It is well produced and fully illustrated, and every reader of "The A.P." should send to Messrs. Zeiss Ikon, Ltd. (Mortimer House, 37-41, Mortimer Street, London, W.1) for a copy of the folder, which will be sent free.

A new film with special qualities has just been put on the market by the sole British distributors, Messrs. R. F. Hunter, Ltd., "Celfix House," 51, Gray's Inn Road, London, W.C.1. This is the F.D. film, with a speed of 26° Scheiner or H. & D. 2600. It is an Eisenberger product, and F.D. indicates "Flavirid Double-emulsion." The film has super-imposed emulsions, the upper having the high speed indicated and the lower being less sensitive. It is further protected with an anti-scratch coating and has a red anti-halation back coating. In use, high orthochromatism, total absence of halation, fine grain brilliant definition and high speed are claimed for the F.D. film. It is sold at standard prices in an attractive golden carton. We hope to refer to this new film again after trial.

## Exhibitions and Competitions

Notices of forthcoming exhibitions and competitions will be included here every week if particulars are sent by the responsible organisers.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers. Entries, July 31. Rules in the issue of June 26. California Pacific International Exhibition, San Diego.—May 29–November 11. Particulars from Miss Ruth Kilbourne, Exhibition Headquarters, Balboa Park, San Diego, Cal., U.S.A.

Western Salon of Photography.—June 29–July 31. Hon. Salon Secretary, S. R. Lewin, 107, Shakespeare Avenue, Bath.

Lucerne Salon.—June 29–July 22. Secretary, International Kunst-photographische Ausstellung, Lucerne, Switzerland.

Lincoln Camera Club Annual Exhibition.—Open, July 5–28. Hon. Exhibition Secretary, J. H. Hutchinson, 44, Richmond Road, Lincoln.

Paris International Salon.—October 5–20. Secretary, M. E. Cousin, 51, Rue de Clichy, Paris.

Szeged (Hungary) International Salon.—August 4–21. Particulars from Secretary, Magyar Amatortenykepek Orszagos Szovetsege, Csoportjonak, Szeged, Hungary.

Southern Counties Salon (organised by Camberwell C.C.).—Entries, July 11; open, August 11–31. Hon. Salon Secretary, W. Bertram, 45, St. Lawrence Road, Brixton, S.W.

South African Salon (Johannesburg).—Entries, July 26; open, August 26–31. Entry forms from Hon. Secretary, Johannesburg Photographic Society, P.O. Box 7024, Johannesburg, South Africa.

Amsterdam International Salon.—Entries, August 1; open, September 14–29. Further particulars from Focus, Ltd., Fotosalon, Bloemendaal, Holland.

London Salon of Photography.—Entries, September 4; open, September 14–October 12. Further particulars from Secretary, London Salon, 5a, Pall Mall East, S.W.1.

R.P.S. Annual Exhibition.—Entries, August 16; open, September 14–October 12. Further particulars from Secretary, 35, Russell Square, W.C.1.

Irish Salon (to be held at Mansion House, Dublin).—Entries, September 14; open, November 2–9. Par-

ticulars from Hon. Secretary, Irish Salon of Photography, 18, Morehampton Road, Dublin.

Rotherham P.S. International Exhibition.—Entry forms due, September 23; prints, September 30; open, October 16–19. Hon. Exhibition Secretary, E. George Alderman, Ruardean, Newton Street, Rotherham, Yorks.

Indian International Salon (promoted by Camera Pictorialists of Bombay).—Entries, October 1; open, November 17–30. Hon. Salon Secretary, F. R. Ratnagar, Central Bank Building, Fort, Bombay, India.

G.W. Rly. "Camp Coach" Holiday Competition.—Prize, one week's holiday in camp coach during 1936 holiday season. Photographs should depict any aspect of camp coach holiday. Entries due, October 31. Further particulars from Superintendent of the Line, G.W.R., Paddington Station, W.2.

Leicester P.S. International Exhibition.—Entries, January 24, 1936; open, February 24–March 7, 1936. Exhibition Secretary, H. Foscutt, 19, Doncaster Road, Leicester.

BETTER VALUE THAN EVER BEFORE

**A twin-lens reflex  
with Novar  $f/4.5$   
anastigmat lens for £7.15.0!**

The Ikoflex is a beautifully made twin-lens camera which shows the picture on the ground-glass screen the right way up and in its actual size. The hood shields the image and the high-power magnifier focusses the pictures needle sharp, while the magnifying condenser makes the image as brilliant in the corners as it is in the centre. The lenses, both for taking and viewing the picture, are high-class anastigmats, and the image is reflected to the ground glass by an optically-worked mirror. Self-registering depth-of-focus scale, helical focussing movement, film-winding lever with indicator from 1 to 12, choice of three shutters.

**IKOFLEX PRICES.**

With Novar $f/6.3$ , 3-speed Derval shutter	.. .. .	£6 12 6
With Novar $f/4.5$ , " " "	.. .. .	£7 15 0
With Novar $f/4.5$ , Klio, 1 sec. to 1/175th sec., with delayed-action release	£8 10 0	
With Novar $f/4.5$ , Compur oo Rapid shutter	.. .. .	£10 2 6

The Ikoflex takes 12 pictures  $2\frac{1}{2} \times 2\frac{1}{2}$  on any standard  $3\frac{1}{2} \times 2\frac{1}{2}$  8-exposure roll film, but for preference use Zeiss Ikon Pernox orthochromatic or panchromatic.

**ZEISS IKON  
IKOFLEX**

Zeiss Ikon cameras are obtainable from all good camera shops. Descriptive leaflet free; 80-pp. general catalogue for 3d. in stamps.

# How I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCLXXXVIII.

Señor ORTIZ  
ECHAGUE.

From information communicated to our Special Representative.

"FOR me photography has been the only medium of expression I have been able to use to materialise the greater or lesser artistic feeling of which I am capable. I should no doubt have preferred to be a perfect draughtsman or engraver, but my activities of another order did not permit me to train in this line. I am saying this not with any sentiment of disrespect to photography, but partly to explain my position and my viewpoint in this art.

"Since I am unable to draw, the question becomes one of composition on the focussing screen. Instead of capturing the spontaneous picture by instantaneous exposure, I prefer to study the types of a locality beforehand, to choose my examples, and to select among the available material that which merits recording; and then to plan it according to my fancy in the light chosen, and by means of a few changes between subject and camera, ultimately to settle on the lines and light which, to my conception of things, are most appropriate.

"To such ends I invariably use an ordinary camera, of 13 x 18 cm., on a tripod, with an objective of long focus, which I use at a small aperture.

"I perfectly appreciate the advantages of photography in the manner practised by Alexander Keighley; that is to say by preserving all the natural spontaneousness of the subject, and by taking it by surprise with an instantaneous exposure. This, however, necessitates very suitable scenery, and long periods of waiting, frequently without obtaining satisfactory results; whereas I have only eight or ten days available in a year for taking my negatives. I am therefore compelled to proceed by more rapid and safer methods, even if the results are less spontaneous than they might have been.

"I make a point of using cut films, not very rapid, and at small lens apertures. When working in the sun, as I always do if I can, this calls for exposures round about one second. In this way I manage to obtain negatives full of vigour and tone.

"After having succeeded with my negatives, I had to concentrate my attention upon a method of printing the positives which would adapt itself to my method of interpretation. I have passed through that epoch of curiosity when everything is tried out and tested, and it is a long time ago that I decided, for various reasons, to adopt the direct carbon methods. I refer to those prepared on the basis of gelatine, gum and pigment, which are commercially represented by the Artigue, Artistique and Fresson processes. These require previously to be sensitised with bichromate.

"They are capable of a vigour rarely encountered in other processes, are absolutely permanent, and have equal, if not greater possibilities of control and interpretation with bromoil.

"They have the disadvantage of requiring a negative for contact printing; but as these negatives can be perfectly produced on bromide paper, the drawback is turned into an advantage, since these negatives are easy to handle and to file, and allow of almost unlimited retouching, although I hardly ever do this, since I prefer to touch up the positive.

"Their use is very restricted, as will be noticed in exhibition catalogues; and this is strange, as they are adapted for both free interpretation and for faithful reproduction of the negative."

(A further example of Señor Echague's work will be found on one of the centre Art pages.)

# Pictorial Analysis

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"A TRAVELLER OF THE EAST," by A. L. Syed.

**A** PART from a very fine effect of sunshine and a most attractive sky, the picture provided for discussion this week also discloses an extraordinary sense of movement, the idea of camel and figure and cloud and wind progressing in the same direction being strongly and dramatically suggested.

The feeling arises from the pose in which the animal has been caught; from the greater space in front than behind; and to the inclination towards the right of the tree in the distance. The outstretched neck, the fact that both rider and ridden are steadfastly looking in the direction of movement; the placing and spacing of the legs of the camel, and the uncompromising broadside view are further contributing factors, which all combine to express a sensation of motion as singular as it is unique.

Naturally enough, the figure, as the sole human interest, forms the centre of attraction. As the principal item he is quite forcefully placed, and he and his beast (1) provide the main pictorial theme. He is well "in" the picture, but, perhaps, a little more inclined to the left than might be considered advisable if it were not for the feeling of movement and for the presence of the small tree on the right (2). The introduction of the latter, whether fortuitous or deliberate, has the effect of a balancing accent which permits the principal item (1) to be placed farther to the left than it could be alone. Without the tree, the present position might be tolerated in view of the necessity of providing a greater proportion of space in front, but it would not be by any means as strong, nor would the arrangement seem so finished and complete.

It now seems very well managed and contrived, and the spacing could scarcely be improved upon. The

figures, to some extent, are further emphasised by the shape of the cloud against which they are shown. It curves above and around them, and, by roughly imitating their form and also by suggesting a sense of enclosure, directs the attention to them.

It will doubtless be noted that the level of the viewpoint is low. The camera has been slightly tilted upwards, and the two, in conjunction, have

rule, the impression conveyed by lines of a horizontal tendency is towards a feeling of restfulness and peace. Vertical lines suggest a sense of dignity and are more or less static, but lines or directional impulses on the slant or inclined invite a suggestion of motion. The legs of the camel, its neck, the tree (2) and the main lines of the cloud have a decided inclination, and, while it is known from the way the camel has been caught and shown that he is in motion, the feeling is stressed and that knowledge vitalised by the sense of movement imparted by the slanting lines.

Still, a composition entirely made up of angular lines would be exceedingly jumpy and unrestful, but, with the level line of the foreground, the jumpy tendency is countered and is made to become the means whereby movement of the subject is suggested.

In other respects, too, the work presents features of interest. The sunshine is well suggested, and, here again, the sombre tone of the foreground is useful, and

the effect is further brought out by contrast with the shadow side of the clouds. The lights on man and beast gleam against those shadows, and not only is the effect delightfully attractive, but it forms a tribute to the maker's technique.

The relative tones of blue sky, cloud and the little touches of brilliant light on the figures are extremely well recorded; and their truth of tone, besides being effective in itself, enables the pictorial message to be conveyed in a way that no less efficient workmanship could hope to equal. The pictorial theme is excellent, but it is technique that enables it to be fully expressed. It is clearly a case of a fine subject presenting itself to one fully capable of handling it properly.

"MENTOR."

produced a picture with a low horizon. This lends a certain emphasis to the sky, which is advisable on account of the fine clouds, but, more than this, it shows the figures in splendid relief against them. Not only, therefore, does it give the greater proportion of the picture space to the sky, but it also helps to ensure the dominance of the principal item.

The foreground, appropriately enough, is but a small strip of sombre tone. It endows the print with stability and it serves to maintain the major interest above, but, beyond this, it is very properly unassertive.

Moreover, it provides a fairly strong horizontal in a scheme that mainly consists of lines of angular direction and curves. It gives them strength by force of opposition. As a general

*SOME CRITICAL COMMENTS on  
the Beginners' prints reproduced on the opposite page*

THE gleam of white buildings in sunshine against a blue sky is an effect that always seems particularly charming. Possibly it is because it does not often occur, and when it does it may only infrequently be noticed, but its attraction is undeniable, and something of its beauty has been caught in No. 4, "The Bathing Pool," by W. Livingston.

## **Morning and Evening Light.**

In the ordinary way, the subject is one that would scarcely prove inspiring, but, with the sun shining on it from a comparatively low altitude, its usual aspect is transfigured and the white stonework is made to shine with radiance against the deeper tone of the sky beyond.

It is very nicely done indeed, and the lights are by no means forced up, or without that indication of tone that is so desirable. There is, in the original, too great a stretch of foreground, but in the reproduction this is brought to a better proportion by the amount cut off by the print below, and, in another print, it could be corrected by trimming to the same degree.

This, however, is a minor defect, and the effect, which is the main thing, is both well seen and nicely brought out. The feeling of early morning or evening light is admirably suggested, and in No. 3, "Homestead," by Richard Shaw, there is a hint of a similar suggestion, though, here, the sun is higher and the difference between the whitewashed wall and the tone of the sky is not quite so well marked.

A darker print might be expected to show a greater distinction, for the lighter part of the wall seems rather devoid of tone, and carrying printing a stage or so farther would deepen the tone of the sky without appreciably affecting that of the wall.

## **Distinctions of Tone.**

At all events, it would be worth while experimenting to find out, and, in any case, a little more tone in the sky would be an advantage.

A depth more nearly approaching that of No. 4 would be just about right, and then it is likely that the light on the wall would glow almost as much as in that print. If, at the same time, a shadow could be introduced to come

across the base of the print it would be a very considerable help. These are really matters outside the scope and regulations of the Beginners' Competition, but it is well to be informed about them.

Quite a respectable degree of tone is shown in the sky of No. 1, "Ashdown Forest," by W. G. Miles, but, here also, a little deeper printing would do no harm, and should bring out a bit more of the tone in the lighter portions of the clouds. The forms are good, and it would not have been a bad plan to have given just a bit more space to the sky and a little less—say a quarter of an inch—to the base. The revision would lend a greater emphasis to what is really the more attractive portion as the picture stands, although, had the foreground been in shadow and the distance in light, the present proportions might well be retained.

In No. 2, "Lucerne Cathedral," by Kathleen Butler, a foreground in shadow would be even more effective. The hedge and the tree on the right are aids as far as their tone is concerned, although the first would be better if its line were broken instead of continuing uninterruptedly from one side to the other.

## **Foreground and Distance.**

A gap in the line would establish a connection between foreground and distance, and the composition, which is now by no means badly designed, would hang together better and seem more unified, but the placing of the foreground in shadow would be even more beneficial.

The attraction here lies in the sunlit middle distance. It takes effect, primarily, on the twin towers, and, secondly, on the various buildings beyond. The darks of the hedge and tree, it is true, do show up those lights; but, if the foreground were wholly in shade, they would gain tremendously, and shine in a way that would be incomparably more effective.

Whether such a state of affairs would happen or not is problematical; but, if there were a certain amount of cloud and blue sky, it is just possible that a cloud shadow might fall just along the patch in question and the exposure made before it reached the

towers; or, if the wind were the other way, the exposure could be deferred until the shadow cleared the towers.

## **The Psychological Moment.**

To catch an effect like this wants a bit of doing. It means having everything ready and making the exposure just at the psychological moment when the subject is as it should be. Any hesitation and it would be lost; but, if it should happen to be caught, the result will repay the effort.

As far as getting the subject is concerned, "Durham Cathedral" (7), by L. C. Guilden, provides a case in point, for it was taken from a moving train, and there would be little or no time for anything but releasing the shutter just at the proper time. Having regard to the circumstances, the picture is something of an achievement, and it is really surprising how good it is.

The upstanding mass of the cathedral is seen against the light and makes up most effectively, while the smoke from the intervening chimneys creates a suggestion that is very attractive. The bit of light tone just by the numeral might be subdued with advantage, as also might the lighter notes in the opposite corner, but this is a trivial adjustment and could easily be done in another print.

## **Luminosity and Light.**

The dark of the towers coming against the light of the sky endows the picture with a high degree of luminosity, and a like effect arises in No. 5, "An Inland Waterway," by Arthur C. Parsons; but, in this case, the darkening of tone towards the top is a contributing factor, as well as the projection of the tree against the lighter part of the sky.

This is another case where a bit more sky at the expense of the foreground would be justified; but, in No. 6, "Summer Fields," by G. C. Colmar, where the feeling of light is no less, the longer foreground is warranted by the nature of the landscape and the variety of tone towards the base. Nevertheless, if the bottom quarter inch were deepened in tone, it would tend to throw the eye towards the distance and concentrate the attention more in the picture. "MENTOR."

# With the Beginners

## NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

### FLAT RESULTS.

THERE are many words used in connection with photography whose meaning is quite clear to those who have been initiated into their particular significance, but which convey nothing, or something quite wrong, to others. For example, I knew a photographer who continued to live a normal and comfortable life in spite of the fact that he thought a "thin" negative meant one on film instead of on glass.

Some terms are confusing and misleading. A developing solution "reduces" the silver salts in the emulsion to metallic silver; the longer this "reduction" continues the more silver there is. We can then apply another solution which "reduces" the silver in the sense of lessening the quantity; and the longer this "reduction" continues the less silver there is.

When it comes to explaining the photographic meaning of "flat," I am afraid it won't do simply to say that a flat negative is one that produces

a flat print, and that a flat print is the sort resulting from a flat negative.

If we look out of a window on a foggy day the view outside is flat. There are no very bright lights or tones, and no strong, deep shadows. There will probably be no really brilliant colour, and the whole scene is more or less a scheme of grey tones.

The same view on a sunny day will be very different—bright highlights, well-marked shadows, perhaps the most brilliant colours. Things stand out in bold relief; the third dimension is strongly in evidence. The result as a whole is the very opposite of "flat."

It is worth noting, however, that the sun may be shining from directly

Fig. 1.

behind us, full on the subject; and then the relief caused by shadows will be less marked; the feeling of the third dimension is less emphasised; and there is a sort of "bright flatness," very different from the "dull flatness" of a foggy day. It is really nothing more or less than a question of light and shade contrasts, and when these contrasts are slight the result is "flat."

I hope that clears the ground a bit, and it ought to be evident that the print of Fig. 1 is flat, while Fig. 2 is not. Yet the negatives were made (years ago) at the same time, and they were both exactly alike—both "flat." I was trying plates which turned out to be slow developers, and received only the development time suitable for plates of a different character.

This shows that one of the causes of a flat negative is under-development. Insufficient silver has been deposited to stop the light effectively; even a short exposure of the paper to a weak light gives a dull grey print like Fig. 1.

In this case I strengthened one of the negatives so as to "boost up" all the silver deposit; where there was most silver the "boosting" was greatest. I have often described the method, but here it is once more.

Crush 100 grs. of potassium bichromate in 10 oz. of water—warm if you

Fig. 2.

want to speed up—and then add 50 or 60 minims of hydrochloric acid. Do not use the common “spirits of salt,” but ask the chemist for the B.P. or C.P. quality, or even for the “pure.” This bleaching solution can be used as long as it works quickly.

Put the negative, wet or dry, in a dish, pour over enough of the solution to cover it, and rock gently. The black silver will change completely to a brownish yellow, and the whole of the gelatine will be stained to a brilliant yellow. Wash patiently till the stain has vanished from the clear gelatine portions, and then apply any developer such as M.Q., amidol, or any of the concentrated single-solution developers diluted as for ordinary negative work. This should all be done in diffused daylight. After washing and drying the change in the character of the negative will be obvious. If a little more strength is required the whole operation can be repeated.

Now I could have secured just as much difference between Figs. 1 and 2

as there is at present, without doing anything to one of the negatives. I could have used a more contrasty or “vigorous” paper for one of them, instead of the same normal paper for both. Readers sometimes send me two prints, one made by themselves and the other by a D. and P. firm from the same negative, and ask why their own is so “flat” and dull in comparison. The answer is that the D. & P. people have seen that the negative is too flat and weak for normal printing, and have selected a more contrasty paper to brighten up the result.

A flat negative is not necessarily too weak in silver deposit. It may be dense and heavy. Although it takes a long time to print the result is after all not as bright and contrasty as it might well be. This is due to over-exposure followed by full development.

Years ago it was almost definitely assumed that the hand-camera user did not over-expose. He could and did under-expose all too often, but he only seriously over-exposed once in a blue

moon. But blue moons and all sorts of other blues are more common and popular nowadays. With modern fast lenses and super-extra-ultra-rapid emulsions, over-exposure is frequent, and it may be carried to such an extreme that the resulting negatives are not only over-dense but distinctly flat.

For this I know of no remedy so simple as the one I have just described for increasing the strength and contrast of a weak negative. Some of the foggy general deposit of silver may be removed first with a reducer such as Howard Farmer's, and the remaining image intensified, but it is the sort of operation I do not love, and the final result seldom calls for enthusiasm.

It must not be forgotten that a more or less “flat” print may be what is required for the particular subject and effect. If so, well and good. But if a brighter result is wanted I would advise the beginner to see what can be done by choice of paper, and only then to resort if necessary to modification of the negative. W. L. F. W.

## Distances at Sea

A practical note for the amateur photographer on a cruising holiday.

THE majority of snaps taken on holiday cruises during the summer months naturally deal with incidents and events occurring on board ship and during excursions ashore, and, with a measure of common sense and perhaps not too high a critical standard, most of these will satisfy their owners as adequate records of their holiday.

There is, however, one class of subject which causes more disappointment than any other, even where “technique” has been perfect, and that is the marine landscape or “landfall.”

The sight of land has a variety of effects upon individuals, and whereas the advanced photographer would probably resist any temptation to expose, the beginner generally falls at once into the error of trying to record what he sees, the resulting images on his negatives being barely recognisable even with extreme enlargement.

Furthermore, as many people have their films developed at a later date, possibly not before their return home, this waste of material is not discovered until too late.

The use of a focussing screen does much to prevent this waste, since it reveals the image as it will appear in the final print, but the majority of beginners, to whom these remarks particularly apply, use film cameras which are not fitted with focussing screens. It is, however, possible for

the camera enthusiast, whatever his camera, to include snaps of this sort in his holiday batch if he attacks the problem systematically.

First, it must be remembered that distant objects viewed across an expanse of level sea nearly always appear closer than they really are. The human eye is able to make allowances for this which the camera cannot make, and it requires considerable experience to determine whether a given coast-line is, say, five miles distant or only two.

But as it is a matter of some importance to our schemes to know this, the first essential is to find someone on board who is a reliable judge of distances, preferably some member

of the ship's personnel, since fellow-passengers, however well-meaning, are not dependable.

Having done this, and there is usually plenty of time when approaching land, it is advisable to draw up beforehand certain rough limits beyond which no exposures are to be attempted.

What these limits are will depend largely upon the nature of the coast-lines encountered.

To all who cruise in the Mediterranean the “Rock” is sufficiently striking in contour to snap at a distance of four to five miles, but it is better to wait until nearer, say two to three miles, for a more satisfactory photograph. It will be found, however, that even then detail is not well marked in either, and for this subject one and a half miles should be the limit.

A quarter of a mile should be the minimum for passing ships, and leaving harbour is the best time to catch them.

Finally, the time to turn your attention towards the shore is when passing through narrow straits, rounding promontories, where there is deep water, or approaching harbour. Your best “landfall” snaps will certainly come from these occasions, and if you confine yourself to a passive admiration of any view which exceeds the limits outlined above the fear of wasting material need not worry you.

P. F. W.

A snapshot of the “Rock” at a distance of two miles.

# Picture Points for Beginners

by "RICARDO"

(1)

(2)

ALTHOUGH using the camera at eye-level is suitable for the majority of subjects, it sometimes happens that a low point of view is best. This particularly applies to babies and small animals on the ground. In the case of a small child seated on the ground (1) the head, which is nearest the lens when the camera is pointing down, will be out of all proportion to the rest of the body. The viewpoint for this subject should be much lower to get correct perspective. If the child, however, were lying flat on the ground, then a high viewpoint would not matter, because the whole of the subject would be in one plane.

A tall standing figure should, on the contrary, never be photographed from a low viewpoint (2) or the distortion will be in the other direction and the head too small. If you must have a low viewpoint, as, for instance, photographing from the lower part of a series of steps and looking upwards, it is generally best to get a fair distance from the subject, say from ten to fifteen feet. A low viewpoint in some cases, however, adds to the effect of height. This fact can be usefully applied when photographing short people when standing. Keep the camera at waist-level, and if tilting it, move back until the figure is well within the view-finder.

(5)

WHEN photographing animals, there are several points to observe. In the first of these two sketches (5) several faults are indicated which frequently occur. First, this side view shows only two legs and the hoofs are too near the bottom of the picture. This does not leave enough ground for support. The viewpoint chosen was too high, thus making the back of the cow in a line with the horizon. This horizon line should be watched in all outdoor pictorial photography. It will not be seen at the time, but undoubtedly will impress itself on the vision when the print is seen. A viewpoint farther to the left would have given more space in front of the head and would show all four legs. The viewpoint should also have been lower, as shown in the second sketch (6), which would give greater impressiveness to the animal and at the same time place it above the horizon line. These points are worth bearing in mind when photographing any similar subject.

(6)

WHEN taking a portrait, never put the subject in direct sunlight, particularly at midday when the sun is high. This will cast triangular shadows under the eyes, nose, mouth and cheekbones that are not pleasant (3). If the subject is wearing a broad-brimmed hat, it is a good plan to reflect some light upwards by means of white paper or cloth on the ground to lighten the shadows. In the example given too much has been included; the dotted line shows the best trimming for this arrangement. Never place a sitter

(3)

(4)

against a background such as an ivy-clad wall, particularly in sunlight, or the spots of light will be particularly objectionable. If the sitter is a woman, a very large broad-brimmed hat can sometimes be turned to good account in making a setting for the face, even in bright sunlight. It can serve both as a partial background, if carefully arranged, and can also be made to cast a pleasing shadow across the face, provided light is reflected upwards.

This (4) shows a more interesting arrangement for portraits, and is known as "three-quarter face." Here the head dominates because of its strong position in the picture and the lack of counter-attractions from the background, which is simple and direct. In portraiture, it is best in most cases to ask the sitter to look in the same direction in which the head is pointing. If the head is turned in one direction and the eyes in another, a "sly" expression is introduced. The only exception to this is when the head is turned away and the eyes are looking back and straight out at the camera. The dotted line again suggests the best trimming for this picture.

AT this time of year, when many snapshots are being taken at the coast, the following points should be remembered. The sea subject and rocks can, however, when skilfully handled, make impressive pictures. The direction of lighting should first be studied. Midday sun can make hard contrasts with heavy shadows, and, if under-exposed, produces results that are known as "soot-and-whitewash." Under-exposure should therefore be avoided, and these subjects are best photographed in the early morning or late afternoon. In the first picture (7) the point of view has allowed the rocks to come exactly halfway in the picture and the horizon line to divide it into halves. This causes it to "quarter" the picture and so weakens the composition. In the second picture (8) the balance has been restored by including more sea and less rock, and a lower viewpoint puts the skyline in a more interesting position. Notice, too, that by including a figure the height of the rocks can be assessed.

(7)

(8)

# Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

## The Technique of the Moving Camera Shot

By "COMPUR."

The moving camera or "tracking" shot is amongst the most expressive in all cinematography. Hints on the execution and use of the shot are contained in the article which follows.

WHEN commercial "talkies" came to revolutionise the motion-picture industry, it was soon apparent that the movements of any ordinary film were to be governed not by cinematic cutting but by the requirements of dialogue itself. Thus it was found rather awkward to put over a lengthy passage of speech without prolonging visual cuts to the point of monotony.

In order to overcome this difficulty, René Clair and one or two similarly capable directors sought out an alternative for the familiar *violent* methods of changing from one scene to another—and so the moving camera shot was evolved.

Despite the reasons for its origin, the device remains one of the most valuable we have in "silent" cinematography today; it represents a definite advance in the methods of film expression, so much so that every amateur interested in serious work should embody the tracking shot in his camera technique.

### Mobility.

This tracking shot differs from the so-called "panoram" in that whilst the latter consists of swinging the camera *in locus* about a fixed axis, the track implies absolute freedom of movement for the whole camera. In actual practice, satisfactory results have been achieved by mounting the camera upon a smooth baseboard and sliding this along a simple, polished guide. On several occasions, too, the camera has been mounted in a motor car, and the latter (with its gear at neutral) pushed by hand for the full length of the track.

Other and more ambitious methods exist in plenty. Some of the commercial studios possess their own elaborate "trolleys," operated by electric motors, and capable of free, vibrationless movement in any direction. Amateur workers cannot, of course, hope to possess such luxurious equipment; but they can and do build their own trolleys—and they turn out tracks which are certainly as expressive as those of their professional brethren.

### Speed.

Always the effect of the tracking shot is governed by the speed at which the camera trolley is moved. Slow movement is indicated in the case of explanatory shots, rapid movement

being most valuable where need exists for heightening the film *tempo*.

It is helpful, too, to have all approaching and rising tracks carried out with studied deliberation, using the faster movement only for retreating and falling shots. "Zipp" tracks, similar to those used by Clair in "Sous les toits," are most expressive—provided they be used with thought and care.

### Adjustments.

The fact that the camera may require to be mobile within the limits of a very appreciable field may be accepted as imposing extreme demands upon the capabilities of equipment. Focussing, for example, needs to be operated with selective care whenever the wide-aperture lens is tracked through the range of mid-shot and close-up; whilst action must be so arranged that adequate concentration will obtain at all distances

of the shot. Occasionally, too, deficiencies in artificial illumination may necessitate a careful control of the lens aperture.

Not one of these adjustments can be carried out by the worker in charge of the camera. His concern for the moment is camera mobility, all lesser adjustments being matters for the mind of an assistant. For reasons of efficiency, however, it is usually advisable for the two to rehearse their shot until absolute smoothness and co-operation exist.

When cutting such shots into a film assembly, it is advisable to avoid placing them in juxtaposition with flashes or very short cuts. It is also ridiculous to divide a full track for purposes of cross-cutting, yet striking cross-cuts can be established by supporting the complete track with lesser parts printed in duplicate from the original.

During the hot weather subjects similar to the above can be secured in Trafalgar Square, and are likely to prove of value to the cinematographer dealing with London life.

# Your Holiday Film

By

M. A. LOVELL-BURGESS.

SO far as I know, amateurs have not as yet made any record of the Youth Hostels, either in this country or on the Continent. Life in a Youth Hostel would be a subject of special interest to young people. There is a fascination about these new inns of the countryside, where youth meets for a brief space in its looting of enchantment, gaily "roughs it," talks those long talks that send the sun down the sky, and goes its merry way. Youth Hostels offer a new way of giving continuity to a scenic film.

The International Friendship League are sponsoring walking holidays at home this summer which provide wonderful opportunities for amateur cinematographers. These walking holidays include "The Pilgrims' Way" (August 3rd to 10th); "The Lake District" (July 20th to 27th); and "North Wales" (August 10th to 17th). As each party will put up at Youth Hostels, the cost will be very small indeed. Applications should be made to Mr. Reginald Graveley, I.F.L., 13, Tavistock Square, W.C.1.

The charm of a camping holiday lies largely in the camp fire, but, from a cinematographic point of view, firelight does not provide sufficient light for a

good picture. So if you are camping or hiking take some flares with you. They can be had from most firework dealers—Brock's and Pain's, London, for instance—from about 1s. each.

In taking your film, whatever it may be, here are a few points worth bearing in mind. Remember a low or a high angle can sometimes give distinction to an otherwise indifferent scene. To obtain the best possible lighting effects check exposures with an exposure meter for each new sequence or scene. It isn't necessary to follow slow-moving subjects with your camera. Let them come in and out of your viewfinder. But every now and again incorporate close-ups and near views. Never pan quickly, however much the subject may tempt you. The only result of quick panning is a series of blurred images. Swing the camera gently and slowly with your body from the hips. It is as well to practise this movement as you would any other physical exercise.

If your interest film takes you—and your audience—over a fairly wide area a continuity device is to make your tour conform to a map and to preface each sequence with a shot of the route which is being followed. In a cruising film shots of the ship from various angles

can be made to bind the film together.

It is advisable if you have a good hand camera to take it along and get some "stills." They will come in useful for publicity purposes later on if the film is to be shown at the club, and you can also include particularly fine stills—photographs better, perhaps, than your ciné camera is capable of getting—in the film itself. But in the latter case, be careful your "still" does not include an action subject. A worth-while "still" which does not depict action can be faded in and out of a film without your audience being any the wiser.

The Scottish Photographic Federation offers the Brewster Trophy for the best amateur film submitted to the annual Salon. There is no restriction as to subject, but all films must have a maximum length of 50 ft., 8-mm.; 120 ft., 9.5-mm.; 200 ft., 16-mm. The Ciné Secretary, Mr. R. Steedman, 14, Viewfield Terrace, Dunfermline, will send full particulars to those thinking of entering. Mr. Alan Harper, adviser of the Independent Film Makers' Association, will be in charge of the competition. Incidentally, I.F.M.A. Group Meetings are now held every Monday at eight o'clock at Chequers, 6, Park Road, Upper Baker Street.

## Filming with Flares

By

PETER LE NEVE FOSTER.

THE camping season is in full swing, and no doubt many "A.P." readers are shooting films during week-ends under canvas in the country. Most camping films lack camp-fire shots, though such scenes can easily be made with the help of magnesium flares.

Photoflares are not expensive, and can be obtained from any of the firework manufacturers. If a few are taken on the next week-end trip they will enable some attractive and unusual pictures to be made which will be very well worth the small trouble and expense involved. Flares can be purchased in various "burning times," and the "half-minute" size is probably the most useful.

Certain precautions must be observed if good pictures are to be made and

accidents avoided. The lens must be shielded from the direct glare of the light or bad halation will result. The actual flare should be masked behind a dummy "camp fire" made of a pile of sticks and earth, or a member of the party could be asked to sit between the flare and the camera. In the first case a good imitation of a real camp fire will be obtained, with the faces of the campers lighted up with bright, possibly a little "flickery," light. In the second case a good silhouette of your companion outlined against the "fire" should be obtained.

Several flares, say three, are needed for really good results. These should be placed quite close together and should be lit as nearly as possible at the same

time. The camera should not be started until all three flares are burning properly. Use the largest aperture available and focus carefully. It is advisable to fix the camera on to a tripod, because the hiss of the flares as they start is apt to make the camera-man give an involuntary jump which is ruinous to films made with the camera held in the hand.

Don't get too near to blazing flares, because magnesium burns can be very painful. Make sure that the wind will blow the smoke away from the tent and away from your camera. Even the best of lenses will not make pictures through a smoke-cloud, and tent fabrics are highly inflammable. A tent full of smoke is liable to become quite uninhabitable for the next hour or so.

## Helpful Holiday Hints

THE following hints are from "Pathscope Monthly," and will be appreciated by every reader of "The A.P." who uses a Motocamera.

1. First and foremost—hold the Motocamera firm and steady. Slow-moving subjects need not be followed, but allowed to pass in and out of the viewfinder.

2. When it is necessary to pan, avoid a blurred image on the film. *You cannot pan too slowly.* Swing the body gently at a constant speed from the hips.

3. A low angle often adds to the effect of a "shot." Similarly, filming

from a position overlooking a scene sometimes adds to the resulting pictures "something different."

4. Check exposures with an exposure meter for each change of scene and light. Study viewpoints, angles and lighting conditions; they do much to make or mar productions.

5. Do not let sequences in the film last longer than ten seconds unless the subject really warrants longer exposure.

6. Subjects far removed from the Motocamera demand the use of a telephoto lens. Without this accessory such "shots" lack interest and movement.

7. Do not go over the same ground time and time again. Repetition of the subject will not be appreciated by the audience viewing the film on the screen.

8. Intersperse the film with "close-ups" taken at not more than fifteen feet away. Near views are effective, give contrast and additional interest.

9. Unique films are often made from commonplace subjects. It all depends upon the treatment—i.e., the way the "shots" are taken.

10. Wherever you go, whatever you do, take your Motocamera with you—and plenty of film.

# Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

## THE ENLARGER PROBLEM.

SIR,—The letter of H. W. in your issue of the 19th June raises a point which does not appear to be dealt with in most textbooks, and about which there seems to be a good deal of perplexity. I refer to the statement he quotes that, since a diffusion enlarger minimises the effect of blemishes, scratches, etc., of the negative, it follows that the finer detail of the negative must also be lost on the enlargement.

This idea shows a lack of understanding of the *modus operandi* of the two systems. In the first place, if there is a scratch upon the emulsion side of the negative, either type of illumination will leave it equally apparent upon the enlargement, provided that the latter is made of the same depth and contrast in each case. (For reasons not connected with the matter in hand, this will necessitate a slightly harder paper being used with the diffusion method.) The same applies to retouching marks.

It is with scratches on the clear side of the negative that the diffuser scores. Using this method, the light from the diffuser falls upon the negative from all angles, and that portion of the image immediately opposite the scratch is almost fully illuminated by oblique rays. With the condenser, however, all the light meeting the negative is converging towards the lens, and the rays of light over a small area are approximately parallel and perpendicular to the negative. Hence a fairly sharp shadow is thrown upon the negative image and appears equally well defined upon the enlargement. A similar effect which is familiar to all is the difference between the shadow of, for example, a thin stick in bright sunlight, and the shadow when the sun is obscured by light clouds. In the first case, where the conditions are similar to that of condenser illumination, a sharp shadow is thrown. In the second case, with the light diffused, a faint, blurred shadow or none at all is seen. But an object can be photographed with equal sharpness by either light, and similarly the definition of enlargements made by either condenser or diffuser will, other things being equal, have equal sharpness.—Yours, etc.,  
R. E. C. DAVIES.

## WHY NOT AN "A.P." CLUB?

SIR,—With reference to Mr. Willatt (and others) regarding the forming of an "A.P." Club, suppose we begin to come down to terra firma and endeavour to materialise the hopes and wishes, etc., of those interested in the idea. I, for my part, would be willing to meet others or hear from them, who would be interested in this proposal with the view of forming a set of rules covering the ideas stated in previous numbers of "The

A.P." and submitting them for the approval of the Editor, and if they are satisfactory and the scheme practicable (this, of course, depends on our worthy Editor, as to the time and expense which it will incur) then all would be well. Failing this, we could, with the co-operation of "The A.P." and some enthusiastic amateurs, push the business ourselves. Herewith is my address: 38, Sladefield Road, Ward-End, Birmingham. Hoping that the same enthusiasm will stimulate others into action.—Yours, etc.,  
LIONEL DEACON.

## EXPOSURE METERS.

SIR,—With regard to the letter concerning the exposure of two Leica cameras, one at  $1/40$ th,  $f/6.3$ , the other at  $1/200$ th,  $f/4.5$  and an  $\times 3$  filter, I find on working out the problem that the exposures were hardly different at all. My method of calculating relative lens stops is to square the  $f$ /number. Hence the problem is (a)  $1/40$ th at  $f/6.3$ , (b)  $1/200$ th at  $f/4.5$ ,  $\times 3$  filter, by this  $f/6.3^2 = 39.69$ , and  $f/4.5^2 = 20.25$ , i.e.,  $f/6.3$  is half the size of  $f/4.5$ .

Therefore (b)'s exposure would have been  $1/100$ th at  $f/6.3$ , as he used a  $\times 3$  filter his exposure would be about  $1/33$ rd. Thus from this I presume that A. C. S. Irwin has made a mistake in his calculations. I may be wrong in mine; if so, doubtless some other reader of "The A.P." will draw attention to the error.—Yours, etc.,  
A. J. BAILEY.

## FILM ECONOMY.

SIR,—Mr. Underhill's article in your issue of the 12th inst. is interesting and useful, but there is a difficulty upon which he does not touch. As the exposed film is wound on to the spool the diameter of the latter gets progressively larger. Accordingly each succeeding complete turn of the winder takes up more film than its predecessor. Obviously, allowance must be made for this, presumably by shortening the number of turns or part-turns, as the exposures progress. If Mr. Underhill can kindly explain a reliable method of dealing with this difficulty I am sure many of your readers, like myself, will be greatly obliged.—Yours, etc.,  
JOHN LEA.

## RENOVATING CAMERA.

SIR,—The following may be of interest to readers of "The A.P."

To renovate the leather covering on a camera apply ordinary indian drawing ink with a camel-hair brush, allow to dry, and then polish with a soft cloth. A really excellent finish is obtained.—Yours, etc.,  
EDWARD G. DOVE.

# THE WEEK'S MEETINGS

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

## Wednesday, July 3rd.

South Suburban and C.P.S. "The Camera for Landscape." J. Ainger Hall.  
Stafford P.S. Acton Trussel.  
Stockport P.S. One-Man Show. J. J. Rothwell.

## Thursday, July 4th.

Hammersmith H.H.P.S. Discussion on One-man Show. P. B. Jenkins.  
North Middlesex P.S. Competitions. Members' Queries.  
Rochdale P.S. Visit to Rochdale Parish Church.  
South Suburban and C.P.S. Dorking.

## Friday, July 5th.

King's Heath and D.P.S. Print Criticism.

## Saturday, July 6th.

Bath P.S. St. Catherine's Court (Federation Outing).  
Nottingham and Notts P.S. Welbeck Abbey.  
Plymouth I.P.S. Gunnislake and Morwellham.  
Sheffield P.S. Hickleton. Meet Exchange St., 2.10 p.m.  
Southampton C.C. Itchen Abbas and Ovington.  
South London P.S. Camberwell.  
Stockport P.S. Prestbury. Visit to Norman's Hall.  
Walthamstow and D.P.S. River Trip. Meet at Waterloo Station, 2 p.m.  
Wimbledon C.C. Wimbledon to Epsom Downs.

## Sunday, July 7th.

Borough Poly. P.S. Ipswich.  
Hammersmith H.H.P.S. The Cotswolds.  
Hanley P.S. Dane Bridge.  
Worcestershire C.C. Cheltenham.  
York P.S. Barnard Castle and Greta Bridge.

## Monday, July 8th.

Blackburn and D.C.C. Enlarging and Accompanying Artifices. T. C. Egan.  
Southampton C.C. Informal.  
South London P.S. "Simple Technique of True Landscape." J. H. Clark.  
Walthamstow and D.P.S. Lords Bushes and Knighton Wood. Meet at "Bald Faced Stag," 7 p.m.

## Tuesday, July 9th.

Leicester and L.P.S. Talk on Cine Cameras.  
Nelson C.C. Winter Syllabus.

## Wednesday, July 10th.

Northants N.H.P.S. Peterborough.  
Rochdale P.S. Debate: How to arrive at the Exposures.

# Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

## Brightening Prints.

Some years ago I used a tube of substance for giving brightness to otherwise dull prints. It was neither a glazing solution nor a varnish. Could you tell me the name of it, and where to obtain it? C. L. P. (London.)

There are many such preparations as that to which you refer, and we cannot tell which particular one you used. Any large photographic dealer can give you a choice of several, including one called "Lustralene."

## Paper Films.

Could you give me the method of developing and printing paper films? A. W. R. (Bodmin.)

If you are referring to films with a paper instead of a celluloid base these are developed in the usual way. You cannot, however, print them in the usual way, but each negative image has to be set up and copied on bromide paper. To do this requires special apparatus, and the makers of paper films intend this work to be done by professional firms.

## Competition Rules.

As I wish to participate in your competitions will you give me details of them? A. W. C. B. (London.)

The complete rules of all our monthly competitions are published in the last issue of each month. You will find them in "The A.P." for last week.

## Fogged Negative.

What is the cause of the patch of fog as shown in the enclosed print. The camera is a V.P.K., and the patch appears in the same place on many of the negatives. H. B. (Tipton.)

We cannot say definitely what is the cause of the fogging, but we think that the most likely cause is a small hole in the bellows. We should advise you to send the camera, with specimen prints, either to Messrs. Kodak, or to one of the firms of repairers advertising in our columns. They can locate and remedy the trouble better than you can yourself.

## Entering Competition.

I want to send prints for one of your competitions. Should I class them as Intermediate or Beginner, or send them as amateur snaps? I do not develop or print my own snaps, but photography is just a hobby. H. B. M. (Southport.)

As you do not do your own work throughout there is only one of our photographic competitions open to you at all, and that is the Beginners' section. Full rules are given in the last issue of each month. You would certainly not find photography a less interesting hobby if you did your own work throughout, and this would make you eligible for other competitions as well.

## Restoring Bromide Paper.

Can you give me particulars for restoring bromide paper that has been lying by for a considerable time? R. A. C. (Goodmayes.)

If your bromide paper is capable of being restored the best plan is to immerse the paper in the following solution for one minute:

Potassium permanganate	5 grs.
Sulphuric acid	.. 30 min.
Water	.. 50 oz.

Then transfer the paper to:

Sodium sulphite	.. 200 grs.
Water	.. 10 oz.

After a minute, rinse, and the paper can be used while wet, or dried in the dark for future use. Its speed will probably be reduced to half what it was originally.

## Length of Hood.

How can I obtain the maximum length of a lens hood? D. E. M. (Leyton.)

The only practical way of arriving at the maximum length of a lens hood is by actual test while watching the image on the focussing screen. If your camera has a rising front you will have to allow for this, and you must test the hood with the smallest stop you are likely to use in practice, as this also makes a difference.

## Adding Shutter Speeds.

I have a shutter with two speeds marked. Can I use any calculation or buy any appliance to give further speeds in fractions of a second? B. A. S. (Sheffield.)

Such a shutter as you have is limited to the short mechanical exposures marked on it, and nothing you can do will give you further speeds.

## Uneven Illumination.

I send a sketch of an enlarger, but I cannot get even lighting of a quarter-plate negative. I get a small bright patch in the middle. Must I use some sort of a lens between the lamp and the negative? J. K. B. (Shrewsbury.)

You will find it quite impossible to illuminate a quarter-plate negative evenly by putting a single lamp behind it. You will improve matters by interposing between the lamp and the negative a sheet of ground glass. Two will probably be still better; but even then the illumination is not likely to be quite satisfactory. The best course is to have a condenser immediately behind the negative, but you will then have to arrange the lamp so that it can be properly centred and moved backwards and forwards.

## Spoilt Negatives.

Why are the enclosed negatives so badly stained? Was the temperature too high? How can I clean them? J. E. P. (Swindon.)

We do not think you can do anything with the negatives you send; they are all much under-developed, and the stains are not due to the temperature, but probably to the use of stale or exhausted solutions, and it is almost certain that the negatives were only partly fixed. Unfortunately, these things cannot be remedied once the mischief is done.

## Use of Filter.

Does panchromatic film require a yellow filter? Would it be necessary for reddish sunsets? I should like the information before I leave for my holiday. R. S. (London.)

For many subjects a filter is necessary with a panchromatic film to get the best results possible. It may or may not be necessary with a sunset. In any case, the purpose of the yellow filter is to cut out some of the blue rays, and if your subject is not one that has these rays in excess you should not use the filter. We should advise you, further, not to use a filter for the first time on your holidays, but to find out beforehand the necessary increase in exposure with the particular film you are using.

## Securing Distance.

I send some negatives to show that I do not get a satisfactory rendering of distant views. Can you help me? K. J. S. (London.)

We should advise you, when the principal part of the subject is the distance, to give less exposure than you are giving at present, and, in any case, to shorten development considerably. The great trouble with the negatives you send is that you have blocked up the fully-exposed distance and sky by over-development. You seem to be getting, too, a serious number of pinholes, which should be avoided by dusting out the inside of the camera.

# "I prefer a Rolleicord because—"

"Its high-class precision qualities and its popular price appeal to me, as being the best camera value I can get."

"I can get reflex quality pictures at roll film cost (12 pictures on 3½×2½ 8-exp. film for only 1d. each)."

"My photography costs me less—as enlargements are not necessary."

"It is simple to use—I can see my picture, actual size, all the time—I NEVER get a dud picture."

"I can take all kinds of subjects and get perfect results in any kind of daylight—and, if necessary, the scope of my photography can be widened by the use of a plate back and numerous other Rolleiflex accessories."

"I have used many other cameras, but at its price I have never yet struck one that appeals to me half so much as the Rolleicord."

VERY GENEROUS EXCHANGE ALLOWANCES.

# ZEISS—

**PHOTOGRAPHIC LENSES**—apart from their unquestionable superiority of design—are manufactured under such ideal conditions that

## The BEST DEFINITION

is assured for each and every lens which succeeds in passing the stringent tests of the ZEISS factory.

## For MINIATURE CAMERAS

the **UTMOST PERFECTION** of definition is a *sine qua non*, and neglect to insist on a ZEISS lens is undoubtedly responsible for many failures and much disappointment to owners of miniature cameras.

Write for List P. 51, and details of the best lens for **YOUR** camera, to **CARL ZEISS (LONDON) LTD.**  
37-41, Mortimer St., London, W.1

# HAVE YOU A CINÉ CAMERA ?

**IF SO — get to know about the P.P.C.**

The **Presenta Pocket Ciné** is unique. In addition to projecting your 9.5-mm. films independent of mains electricity and bulky apparatus, it also allows you to see them in motion, without the aid of any artificial illuminant.

No matter where you are, the P.P.C. enables you to show your friends your "pictures" as no other projector can.

Self-contained in an attractive Bakelite case, the P.P.C. slips into the pocket and is always ready for instant use.

For holidays it is ideal, and the unique visualising feature makes it indispensable for "editing," etc.

**25/-**

POST FREE.

Cash or C.O.D.

Obtainable from all Photographic Dealers, Stores, etc., or direct from

**PRESENTA Ltd., 74, CHISWELL ST., LONDON, E.C.1**

## A Competition specially for Novices

**SUBJECTS.**

Prizes will be awarded for the best snapshots of family groups or single figures taken at home or on holiday, indoors or outdoors. The arrangement of the groups or the pose of the figures is left entirely to the discretion of the competitor.

The competition is open only to novices: those who have never won an award of any description in a photographic competition.

Entries are restricted to contact prints. The smallness of the prints, which may be mounted if necessary, will not affect their careful consideration in this competition.

**PRIZES.**

The prizes will consist of supplies of roll film or of plates (if any winner happens to use a plate camera).

THE FIRST PRIZE WILL BE TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.

THE SECOND PRIZE WILL BE TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.

THE THIRD PRIZE WILL BE ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.

TWELVE PRIZES OF ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

The winners of these prizes will thus be encouraged to continue their photographic activities throughout the year with a supply of free film.

**RULES.**

Each print must have affixed firmly to the back, a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor.

The latest date for receiving entries is September 7th, 1935. This will give new readers, who are novices, who intend entering this competition every opportunity of improving their work during the next three months by reading "The Amateur Photographer" every week and obtaining their competition prints during the summer holidays.

The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed as follows: The Editor, "The Amateur Photographer," Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices' Competition."

Further references to the competition will be made week by week, and hints given for the best treatment of groups and figures.

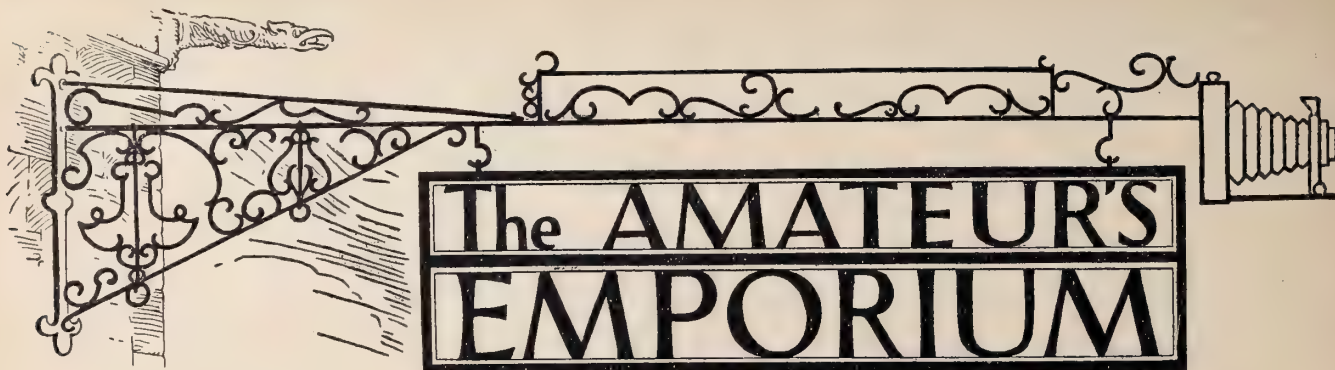

## MOTION PICTURES WITH THE BABY CINÉ

## Business Notices

### Publishing

**OFFICES.**—Dorset House, Stamford Street, London, S.E.1. Telegrams: "Amaphot, Sedist, London." Telephone: Hop 3333 (50 lines).

**PUBLISHING DATE.**—"The Amateur Photographer and Cinematographer" is on sale throughout the United Kingdom every Wednesday morning.

**SUBSCRIPTION RATES.**—British Isles 17/4 per annum, Canada 17/4, other countries abroad 19/6 per annum, post free.

**REMITTANCES.**—Cheques, etc., should be crossed and made payable to Iliffe and Sons Ltd. "The Amateur Photographer" can be obtained abroad from the following: **UNITED STATES:** The International News Co., New York. **FRANCE:** W. H. Smith & Son, 248, Rue Rivoli, Paris; Hachette et Cie, Rue Reaumur, Paris. **BELGIUM:** W. H. Smith & Son, 71-75, Boulevard Adolphe Max, Brussels. **AUSTRALIA:** Gordon & Gotch, Ltd., Melbourne (Victoria), Sydney (N.S.W.), Brisbane (Queensland), Adelaide (S.A.), Perth (W.A.), and Launceston (Tasmania). **NEW ZEALAND:** Gordon & Gotch, Ltd., Wellington, Auckland, Christchurch and Dunedin. **INDIA:** A. H. Wheeler & Co., Bombay, Allahabad and Calcutta. **CANADA:** Imperial News Co., Toronto, Winnipeg and Vancouver; Benjamin News Co., Montreal; Gordon & Gotch, Ltd., Toronto. **SOUTH AFRICA:** Central News Agency, Ltd.

### Displayed Advertisements

Communications on Advertisement matters should be addressed: The Advertisement Manager, "The Amateur Photographer and Cinematographer," Dorset House, Stamford Street, London, S.E.1. Copy for displayed advertisements for the issue of any particular week must reach Dorset House by the first post on Tuesday morning in the week previous. Rates and conditions will be sent upon application.

### Prepaid Advertisements

**SALE AND EXCHANGE: AMATEURS ONLY—**

12 words or less ..... 1/-

1d. for every additional word.

**PROFESSIONAL AND TRADE:—**

12 words or less ..... 2/6

2d. for every additional word.

Each paragraph is charged separately.

**SERIES DISCOUNTS** are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid and posted to arrive at the Head Office, Dorset House, Stamford Street, S.E.1, not later than first post FRIDAY for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 26b, Renfield Street, Glasgow, C.2.

Advertisements are inserted, as far as possible, in the order received, and those received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders sent in payment for Advertisements should be made payable to **ILIFFE AND SONS LTD.**, and crossed

& Co.

Notes being untraceable if lost in transit, should not be sent as remittances.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

**BOX NUMBERS.**—For the convenience of advertisers, letters may be addressed to numbers at the office of this paper. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charges, which must include the words: "Box 000, c/o 'The Amateur Photographer'." Replies should be addressed: "Box 000, c/o 'The Amateur Photographer,' Dorset House, Stamford Street, London, S.E.1." and these letters will be simply forwarded by us to the advertiser. It must be understood that we do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisement. Readers who reply to Box No. advertisements are warned against sending remittances through the post except in registered envelopes. In all such cases the use of the "Deposit System" is recommended.

### Special Note

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

### Deposit System

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Amateur Photographer and Cinematographer," both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10 a deposit fee of 1/- is charged; on transactions over £10 and under £50 the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, one-half per cent. All deposit matters are dealt with at Dorset House, Stamford Street, London S.E.1, and cheques and money orders should be made payable to Iliffe and Sons Ltd.

## CAMERAS AND LENSES

## WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 213, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

## CAMERAS AND LENSES

**L**EICA III outfit, chromium, f/2 Summar, f/3.5 wide-angle, f/1.9 Hektor, universal finder, angular finder, Varyl Enlarger and accessories, Correx tank, special cases and various sundries; cost over £126; never used, £80, or nearest offer; may separate.—Croft, 57, Brook St., Kennington, S.E.11. ## CORRECT EXPOSURE

Price

57/6

Ever-Ready

Leather Case, 5/- extra.

Yours for 5/3 down and 11 similar monthly payments.

The New "AVO" Photo-Electric Cell Meter ensures Correct Exposure EVERY TIME

## EXCLUSIVE FEATURES

1. Equally suitable for "Still" and Ciné cameras.
2. Adjustment provided for plate and film speed.
3. Direct reading—no calculations whatever.
4. BRITISH MADE.

## What a customer says :

"Many thanks for prompt dispatch of the 'Avo' Meter. I have now tried this and am definitely keeping same. It is certainly superior to other meters costing considerably more. I enclose herewith cheque—having deducted the allowance quoted on my old meter, which, by the way, I consider very generous. (Signed) Dr. ———"

(Original may be seen.)

See what your unwanted meter is worth. Let us make you a SUPER ALLOWANCE.

## DEALERS &amp; PROFESSIONALS PLEASE NOTE!

We supply the "Avo" at full trade terms, immediate delivery.

## POST THIS TO-DAY.

Please send me full details of the 'Avo' Exposure Meter, in which I am interested. Also please quote me, without any obligation on my part, your highest Super Allowance on my present meter, which is a

## HAND CAMERAS

By R. Child Bayley

THIRD EDITION

An outstanding feature of this book, which makes a special appeal to all amateur photographers, is a number of separately printed plates, all from hand camera negatives by the author. These are selected to show the very wide range of subjects accessible to the snapshotter, from pure landscape to telephotographic portraiture.

Though primarily written for the beginner, "Hand Cameras" contains much of interest to the advanced worker, and should be in the working library of all who would attain to the highest degree of artistic excellence in their work.

**TAKES YOUR SUMMER HOME**

THE BEACH, THE MOUNTAINS AND THE RIVER—ALL THAT SUMMER OFFERS YOU AS IRRETRIEVABLE, REMAINS YOURS FOR EVER WITH THE LEICA.

Such unique features as combined winding of film and setting of shutter, speeds from 1 to 1/1,000th second, interchangeable lenses to suit various purposes, automatic focussing and unrivalled precision make the Leica

**THE WORLD'S PREMIER CAMERA.**

E. LEITZ (LONDON), 20, MORTIMER ST., LONDON, W.1.

# "PANATOMIC"

## —The Five Feature Film

Every good film has some of the following features to recommend it, but in this, the finest all-purpose film on the market, they are all combined.

**SUPER-FINE GRAIN** for flawless, grain-free enlargements from miniature negatives.

**HIGH SPEED** for short exposures in poor lighting conditions.

**PANCHROMATIC EMULSION** for correct rendering of all colours in monochrome.

**DOUBLE COATING** for long-scale gradation and latitude of exposure.

**ANTI-HALATION BACKING** for rendering highlights without "fuzz."

That is why you should always choose

THE MOST BEAUTIFUL PAPER EVER PRODUCED

*Gevaert*  
**GEVALUXE**  
*VELOURS*

Write for  
GEVALUXE VELOURS  
Leaflet

*for the Autumn  
Exhibition Prints*

The most beautiful paper ever produced  
for the discriminating photographer.  
The surface has the appearance of black  
velvet, yielding prints of a depth hitherto  
unknown, with rich luminous shadows  
and a scale of gradation of extreme  
range.

For the special print—and all others.  
GEVALUXE gives life and beauty to  
all types of subject.

As simple to use as an ordinary Bromide  
paper and as suitable for contact as for  
enlarging work.

GEVALUXE endows the photographer  
with a new power in the making of his  
prints.

WEDNESDAY, JULY 10TH, 1935.

VOL. LXXX. No. 2435.

THE Annual Exhibition of Prize Prints from "The A.P." competitions was opened last week at the house of the Royal Photographic Society, 35, Russell Square, W.C.1. By visiting this show our readers will have an opportunity of seeing and comparing the originals of many of the pictures reproduced during the past year in our pages. "The A.P." competitions have, for the past fifty years, been the training ground for pictorial workers in all parts of the world, and they have never been more strongly supported than at the present time. It is worthy of note that among the prize-winners in "The A.P." competitions of the past have appeared the names of most of the leading exhibitors of the day. In the present exhibition will be seen a considerable number of pictures of outstanding merit, and we look to their authors for some notable exhibits in international shows in the future. The special silver plaque for the best print of the year in "The A.P." competitions is awarded to W. G. Kennings-Kilbourne, of Chertsey, for his picture "To-morrow will be Friday."

### Turning the World Downside Up

The hundred large-sized photographs of Australia which have been showing at Grosvenor House—well hung and spaced, by the way—illustrate not only the excellent work of the Australian Press, but also the sort of thing which might be definitely extended. When a dominion of three million square miles uses a camera to advertise itself on the opposite side of the globe, to show what the world is like down under, it is an example for organisations whose area does not amount to as many square

## TOPICS of the Week

### A WEATHER FORECAST FOR THE WEEK

By D. K. BARTLETT.

#### THURSDAY, JULY 11th.

A fairly settled, bright and warm sunny day in most districts of the British Isles, except in hilly areas in extreme West, allowing for all types of photographic work to be undertaken, without weather problems hindering in any way.

#### FRIDAY, JULY 12th.

Similar weather will continue generally. A thundery tendency, however, off Western coasts of Great Britain should be noted. Advantage should be taken of this bright period and fairly clear atmosphere, as a considerable amount of haze and some fog will continue off the coasts.

#### SATURDAY, JULY 13th.

Mainly fine, with thunderstorm conditions likely in parts during the evening. Take advantage of the middle hours of the day for all outdoor effects. This particularly applies to those resident or staying in Western districts.

#### SUNDAY, JULY 14th.

Remaining fine and warm with thundery conditions, especially in the West of Great Britain. Early morning mist or haze may upset plans for long-distance views, but a certain amount of breeze will clear this later.

#### MONDAY, JULY 15th.

The greater part of the British Isles will be bright and fine, early mist or haze may occur and the thundery tendency will remain in the West.

#### TUESDAY, JULY 16th.

High temperatures will continue and fine weather. Every opportunity should be taken advantage of as a few days of changeable weather will set in shortly.

#### WEDNESDAY, JULY 17th.

The good weather will remain for the most part generally, although the temperatures will tend to fall slightly and an unsettled state will gradually appear.

inches. Incidentally, these were Press photographs, taken by the staff of the *Sydney Sun*. The *Times* in this country has done much the same thing, reproducing in its pages and afterwards exhibiting in a public gallery photographs whose interest does not vanish with the passing moment. Though, to be sure, even with pictures of a more transitory interest, there is not a little pleasure and satisfaction in looking at them some time afterwards, as the little crowds with their faces constantly pressed against Fleet Street windows and showcases bear witness. It is far too much of a fetish in the newspaper world that everything that happened more than an hour or so ago is out of date.

### Touches of Colour.

Going down Whitehall this July day we noticed that grim old Gwydyr House, the home of the Air Ministry, was sporting in every window a window-box full of vivid blooms, giving the austere façade an air of gaiety and irresponsibility, like a buttonhole in an undertaker's dress coat. There are many such gay reliefs if one only looks for them. The most impressive front in Fleet Street, suggestive of the Rocky Mountains, steep and grey, has, projecting from it, a clock which is a perfect riot of colour, the sort of thing one might come upon in a great Oriental circus or in a dream. It always takes our fancy, and we would not be without it for anything. The same with the old Tudor gateway of Lincoln's Inn, as forbidding as it was when Wolsey rode up Chancery Lane; but in the corner is a cheeky little apple-stall, with the brightest fruit imaginable. Not infrequently has such an intrusion made the success of a picture.

### Binocular Vision.

The ability of a man to see stereoscopically is generally thought to be one of his best-established achievements. But Mr. Bishop Harman, consulting ophthalmic surgeon to the West London Hospital, told a conference in London the other day that, on the contrary, binocular vision is a very delicately balanced and easily upset function, highly susceptible to disturbance by fatigue, by slight illness, or by alcoholic indulgence (which explains why some alcoholics see double). Moreover, just as in the case of other high-grade developments, there is a great range of variation between perfection, as in full stereoscopic vision, and a total absence of it, as in squint. Altogether, our judgment of the size and distances of objects is subject to certain severe conditions, some inherent in defects of the muscles of the individual, others arising from his state of health. Visual judgments differ as between man and man, and not only

so but they vary in the individual man with the state of his health, which accounts for the variations in our "form" at work or at games.

### Tinted Eyes.

Some eye specialists now fit what are known as contact glasses, that is, a glass shell the cavity of which is in contact with the globe of the eye with a layer of liquid interposed between the lens and the cornea. Some wearers of these glasses are distressed by their brightness, and so some form of tinting is called for. But the glasses are mostly made in Germany, and we heard an ophthalmic surgeon lament the other day that the Germans, being a blue-eyed race, their idea of ocular beauty appears to be a very dark brown tint, so that he can never get a sufficiently light tint for the contact glasses of his patients. On one occasion he got a light blue smoke, and the wearer liked it very much, but he was an aviator, and lost his contact glasses in an accident,

since which the ophthalmic surgeon has never been able to obtain such tinting.

### Photographs of the Aurora.

The Meteorological Office has been showing at Burlington House a series of remarkable photographs of the aurora. They were taken at British Polar Year Station, Fort Rae, in North-West Canada, on the edge of the Great Slave Lake, and not far below the Arctic Circle. Sixteen plates were shown illustrating various representative types of this luminous meteoric phenomenon. The slide carrying the camera lens was so constructed as to move into six different positions relative to the plate, thus allowing six exposures to be made rapidly in succession without plate change. Attention was drawn to the fact that the positions of the stars relative to the aurora appeared different in two plates taken synchronously at two stations about fourteen miles apart, this being due to parallax.

## READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with on this page week by week. Other replies appear as usual on the last page.

### Fixed-Focus Enlarger.

*I want to turn out numbers of enlargements  $3\frac{1}{4} \times 2\frac{1}{4}$  to postcard. Is it correct that a fixed-focus form is no use for artificial light? Why are they not made for this purpose? Can you suggest a solution?*

F. S. (Carnarvon).

Most commercial fixed-focus enlargers are made for daylight use only. If an attempt is made to use them for artificial light two serious difficulties arise. The first is the even illumination of the negative; the second is that the stop fitted to the lens is a very small one, so that exposures by artificial light are too long to be practicable.

Fixed-focus enlargers for artificial light have been made, even commercially, but the demand is naturally very limited. Such apparatus must have a proper lamphouse and fittings, generally a condenser, and a lens of reasonably good quality and large aperture. All this means that the price approximates to that of an enlarger free from the limitations of the fixed-focus type.

If, as you say, you desire to make runs of enlargements to standard, it is certainly convenient to have a piece of apparatus that will be always ready for the work without preparation and adjustment; and it is a fairly easy matter to construct one.

We reproduce a diagram of something of the sort which was suggested some twenty years ago for making prints from wet negatives, but, naturally, it would be better still for dry ones. At any rate, the fundamental principles are suitable for your purpose, although you would do well to modify some of the details.

The lamphouse must be of metal, but the box part should be made of wood—plywood will be quite suitable. The article illustrated was for a batwing gas-burner, which was found to give a more constant light than an incandescent mantle. The side of the box is slotted to admit the negative carrier, and behind this is a condenser. As the positions of the main elements remain unchanged the illuminant can be fixed once it is centred and the correct distance from the condenser found.

A wooden partition carries the lens, the exact position of which is ascertained by actual focussing. At the end of the box is a sort of spring door or flap. This was pulled back to slip in the bromide paper, which was then pressed by the flap against a sheet of glass fixed in the box. The exposure was made by moving the handle so as to raise a light flap which covered the paper except during the actual exposure.

If an electric lamp is used this flap arrangement can be dispensed with, the exposure being made simply by switching the light on and off.

You might also consider the advisability of replacing the flap back by a printing frame, fitted with a sheet of glass, and with or without masks. As the negative is small you might also consider dispensing with the condenser, and using a pearl lamp with a piece of ground glass or flashed opal interposed between it and the negative.

# Photography on Tour

Successful photography on tour is largely a matter of giving attention to certain points, which are dealt with in this note. They are chiefly in the nature of preliminary preparations.

THE touring holiday, either by some means of mechanical transport, or on foot, becomes more popular every year. If the tour is not intended entirely to supply subjects for the camera, the photographic side should receive consideration. A little forethought may make going easier, and it may also save wasted efforts.

## Apparatus.

The photographer who is blessed with a variety of apparatus will have to decide which camera to take. If his work is of a specialised type he will probably decide upon the outfit best adapted to his particular interests, in spite of the fact that it may mean some inconvenience in other respects.

Apart from this the mode of transport may determine what can be taken, and there are limits in this respect. For example, a quarter-plate reflex may not appear upon first consideration a burden in a small car, but it may be looked upon as taking up rather more than its fair share of room when there are other passengers and their belongings.

Obviously the cyclist, and most certainly the hiker, will not wish to carry any apparatus which represents needless weight or bulk.

## The Ideal Tourist Camera.

From this it will be concluded that the best type of camera for the tourist photographer is a roll-film instrument, and not a few will decide upon one of the miniature type, which in one or other of its several forms has distinct advantages.

The wise photographer will decide to take a colour filter, an exposure meter, and a tripod, the latter of a light metal pattern will not take up much room, and its use may make all the difference between success and failure. It is a good plan when touring by car to devote an attaché case to the photographic apparatus.

## Supplies.

The question whether to take supplies of sensitive material or to obtain these *en route* will have to be decided. This will depend upon the nature of the tour, the country traversed, and the photographer's needs in the matter of films.

In these days supplies of all the popular roll films will be available in every large town, and in most small ones, although in the latter case the photographer may not find his favourite brand stocked. If a popular size of a well-known make is used it is safe to rely upon local supplies, roll films being sold by the general stores in most villages.

If, however, a less popular size is used it is better to carry a supply and obtain more as required by post from town. This is suggested because the retailer in a village shop may not have a quick sale, and there is no guarantee that the films have been properly stored. The expiry date upon the carton may be distant, but a few weeks of bad storage may do more harm than a very long time under proper conditions. The atmosphere which prevails in a small village general shop is not always conducive to the good condition of sensitive material.

There are, of course, exceptions where the proprietor is a photographer himself or appreciates the value of correct storage, but the amateur should be on his guard.

## Film Packs and Plates.

Film packs are to be bought in most towns in the more popular sizes, but there is less choice of make. It is not supposed that the touring photographer will consider taking plates, but if so, and the route does not include large towns, it is well to take a supply, or to arrange for fresh material to be posted on request. If space is a consideration it is a good plan to post exposed plates home, properly marked to prevent opening, to await arrival.

If it becomes necessary to change plates during the daytime a simple changing-bag should be carried. If this is not used, there should be no difficulty about plate-changing at night in one's lodgings. In the country where there are no street lamps, it is generally quite safe to pull down the blind of the bedroom and change plates in a dark corner of the room with one's back to the window.

## Photographic Opportunities.

It is probable that many photographers when on tour miss many of the best subjects, or, to put it in another way, miss the best opportunities for photography.

If the tour is not intended primarily as a means of indulging in photographic work the needs and wishes of other members of the party must have consideration. There are people who resent waiting for the photographer, and hurry is not likely to stimulate the production of masterpieces.

In such cases experience proves that there is much to be said for the miniature camera. The rapidity with which this can be operated, and a large number of exposures made, will allow the photographer so circumstanced to secure pictures under conditions which would be prohibitive in the case of apparatus of a less handy type. It is also a fact that modern high-speed films can shorten exposures, which permits a great saving of time in the case of interior subjects.

## Obtaining Suggestions.

When reaching a district new to him the tourist photographer should examine the postcard views displayed. These should not be imitated, but they give a good idea of the possibilities of the place, and suggest subjects, so that the time may be used to the best advantage. If only a few hours are to be spent in a particular place, such indications are valuable.

*Beginning of the Feast.*

# NATURALISTIC CHILD PHOTOGRAPHY

By LAUREL PASCAL.

ONE of the advantages of the modern small camera is the ease with which successful instantaneous pictures can be made of children; this is due not only to the speed of operations possible, but also to the fact that the kiddies can be snapped in a happy and natural environment.

The amateur photographer in this case scores over the professional. Children carefully washed and brushed and taken along to a strange studio, with sundry admonishments to "be good" and to "keep still," generally become bored and sulky, and the resulting pictures wooden and uninteresting.

With a miniature camera no posing or fidgeting of any kind is necessary. All one has to do is to provide some form of entertainment, books, toys, or a meal, and then get to work as unobtrusively as possible.

Sharp focus is very necessary with large-aperture lenses, and this is where the reflex type of camera is so useful for this subject. With your hand on the focussing screw you can keep pace with the lively movements and fleeting expressions of your little sitters, getting results that fairly sparkle with life—characteristic of the spirit of childhood.

For out-of-door studies of children, an f/6.3 lens will give admirable results,

but for indoor work a lens working at f/4.5 or larger is advisable.

For out-of-door work you cannot do better than to use "Verichrome" or "Selochrome." For work within doors, use a good ultra-rapid film such as Agfa Super-Sensitive panchromatic.

No hard and fast rules can be laid down as to exposures, but always cut the time down as much as you can compatible with good definition. Out of doors during the summer months 1/50th sec. at f/8 will be found fast enough—while seaside and very open studies can be given the same exposure at f/11.

For indoor exposures in daylight, work at the largest aperture, giving from 1/25th to 1/5th second exposure, this depending upon the amount of light available and the activities of your subjects. With two photo-flood bulbs night-time exposures can be as short as 1/25th sec. at f/6.3, if you help out any heavy shadows with reflectors of some kind, white paper or an old sheet.

The tea-party pictures on this page were taken with a Rolleicord on Agfa Super-Sensitive panchromatic film, 1/25th second at f/4.5. The time was about five o'clock (summer time) and the lighting, which was rather poor, helped out by one photo-flood light in a reflector. On a brighter day and an earlier hour the same exposure could have been given with daylight only.

To ensure absolute naturalness my little models were all encouraged to handle my camera, taking imaginary pictures of each other and of me. By the time the big brown pot of tea was made and strawberry jam and cakes produced, photography had mercifully lost its appeal, and there was still something left of my Rolleicord.

*"Do you like Strawberry Jam?"*

# Planned Pictures are much more satisfactory

Nine monthly payments of 65/11.

### SLIPS EASILY INTO THE JACKET POCKET. THE NEW POCKETTE

16-mm.

Weight only 35 ounces; daylight-loading in 5 secs; 50 ft. of film. Single picture device, automatic stop to footage indicator, 2 speeds: 16 and 32 frames per second; interchangeable lens mount. Fitted f/3.5 Ennar anastigmat, fixed focus ..... **£20**

Nine monthly payments of 46/8.

F/2.9 Dallmeyer anastigmat in focussing mount ..... **£25**

Nine monthly payments of 58/4.

### THE RAPID ROLLEIFLEX F/3.5

Zeiss Tessar anastigmat, Compur shutter, speeds

1 to 1/500th second, T. and B.

Price unchanged.

£22:10:0

Nine monthly payments of 52/6.

Absolutely automatic, takes 12 pictures 2½×2½ on standard 3½×2½ roll films.

### SPECIAL OFFER OF SHOP-SOILED

# A Really Universal M.Q. Developer

By E. BARWELL.

THE ordinary M.Q. developer is often described as a "universal developer for plates, papers and films." It is so, to a certain extent, inasmuch as the ingredients, metol and hydroquinone, can be compounded to form a developer for almost any purpose.

There are, however, many occasions, in the case of chloro-bromide papers, for instance, where it becomes necessary to alter the proportions of metol and hydroquinone. There are other cases where it would be an advantage, or even highly desirable, to do so. There must be many amateurs who have occasion to develop and print such widely different subjects as highly contrasty night subjects and lantern slides.

It was with the object of finding a developer which would deal successfully with these extreme cases, as well as with more normal ones, that the formula to be described was worked out.

To start with, it was clear that the M.Q. developer in a single-solution form, as usually made, was quite unsuitable; but it seemed that it could be made infinitely flexible if properly compounded. This turned out to be the case.

The preparation of the developer will be described first, and then the method of using it.

Three stock solutions are required in addition to the usual 10 per cent potassium bromide, making four in all. These are:

## A (HYDROQUINONE).

Hydroquinone .. 120 grs.  
Sodium sulphite .. 2 oz.  
Water up to .. 20 oz.

## B (METOL).

Metol .. 160 grs.  
Sodium sulphite .. 2 oz.  
Water up to .. 20 oz.

## C (ALKALI).

Sodium carbonate .. 3 oz.  
Water up to .. 20 oz.

Also D (bromide), potassium bromide 1 oz., water up to 10 oz.

When making the B solution the sulphite should be dissolved in 10 oz. of warm water, and the metol in a separate 10 oz. of warm water, and when dissolved mixed together. The other solutions call for no comment.

Now for the working solutions for different purposes.

## Plates and Films.

It is well known that for night subjects, theatre subjects, portraiture, or, in fact, whenever under-exposure is to be expected and the contrasts therefore likely to be excessive, a soft-working developer is to be preferred. For this we take: Solution B, 1 oz.; Solution C, 1 oz.; Solution D, 8 drops. This will give a negative full of detail, without much contrast or density, unless development is much prolonged. Very suitable for portraiture and enlarging.

At the other extreme we have process plates and black-tone lantern slides for which a very contrasty developer is required. For this we take:

Solution A, 1 oz.; Solution C, 1 oz. These two developers are extreme cases; for all ordinary purposes take the usual M.Q. developer consisting of: Solution A, 1 oz.; Solution B, 1 dram; Solution C, 1 oz.; Solution D, 15 drops, and add water to make 4 oz.

Similarly by increasing or decreasing the proportion of metol a range of contrasts can be obtained on bromide

papers. Any reader who has tried the three-colour Carbro process will know how difficult it is to get the same contrast on the three prints made from the negatives taken through the red, green and blue filters. This is a case where the above developer will be found extremely useful.

For instance, it is possible to get the same contrast, after a little practice, by developing the blue filter negative first in a developer low in metol, then, after adding a little more metol, the green and red filter negative, with perhaps a little extra metol for the last named. If desired the adjustment may be performed in a similar manner when printing.

Enough has been said, it is hoped, to show that the M.Q. developer, made up as above, has an almost unlimited variety of applications. The trouble of making up four stock solutions is really very little more than that of making up one, as the various constituents have to be dissolved separately in any case.

In conclusion, care should be taken when using hydroquinone by itself, or with very little metol, that the temperature is not allowed to fall below 60° Fahr., or preferably 65° Fahr., as hydroquinone becomes almost inert at lower temperatures.

Below is appended a table showing suggested composition of developers for different purposes, including those mentioned above:

Purpose	A.	B.	C.	D.	Water.	Remarks.
Plates	—	1 oz.	1 oz.	8 drops	No water	Watkins factor 12.
and	1 oz.	1 dram	1 oz.	15 drops	To make 4 oz.	Watkins factor 5.
Films	1 oz.	—	1 oz.	—	No water	May be diluted for more control.
Bro-	1 oz.	1 oz.	1 oz.	20 drops	To make 4 oz.	
mide	1 oz.	1 dram	1 oz.	20 drops	To make 4 oz.	Watkins factor 5.
Papers	1 oz.	20 drops	1 oz.	10 drops	To make 4 oz.	
Gaslight Papers	1 oz.	1 dram	1 oz.	10 drops	No water	Image should appear in 30 sec.
Lantern Plates	1 oz.	—	1 oz.	5 drops	No water	For black tones.
Chloro-bromide Papers	1 oz.	5 drops	1 oz.	30 drops	To make 4 oz.	For warm black tones. For warmer tones dilute 3 times.

A "buffered borax" developer for fine grain may be made as follows: Dissolve 2 oz. sodium sulphite and 18 grs. of borax in 10 oz. of warm water, add 8 oz. A, and 2 oz. of B, and use undiluted and without bromide.

A scheme is on foot to hold an exhibition of Colonial photography in memory of the Outpost Surveyors. This will be arranged by the Outpost Camera Club, which is being formed in connection with the Victorian Colonial Outpost Service League, and it is hoped to gain the assistance of all those in the Colonies interested in the work. The proceeds of the exhibition will be devoted to aged Colonial Outpost Pioneers who have come upon difficult times and have no pension. The work of these pioneers has been very hard in the past and

many sacrifices were made in opening up the dark places of our tropical Empire to make them fit for settlers to live in comfort. It has been suggested that a certificate be designed and that the purchase of this entitle the holder to membership for life, with the usual service of a club for those visiting the home country. Early colonial photographs will be useful, and gratefully received from those who have them, both at home and abroad. Further particulars will be supplied by Mr. A. E. White, 25, Godstone Road, Kenley, Surrey.

July 10th, 1935

# PURE

By F. READ.

*The Wye Valley. From the Wyndcliffe (800 ft.).*

SEVERAL times within the past few months letters have appeared in *The Amateur Photographer* regarding landscapes. They express, broadly speaking, their writers' favour of the pure landscape type of picture which seems of late years to have lost its hold on the pictorialist who, in his search for subjects, has neglected the appeal of the landscape picture and pays attention only to the "modern" type.

It cannot be denied that in many exhibitions to-day the landscape seems almost to have ceased to exist. On most exhibition walls there will be found the usual large percentage of figure work, bizarre, nude and otherwise, with a good mixture of sunshine subjects with their glorious appeal of the effects of light and shade, and if a search is made there may be seen an occasional pastoral type of subject that represents the exhibition's entry of landscape work.

It is difficult to account for this lack of a subject that was at one time universal. It is not twenty years ago when the case was different, and the usual idea of the keen photographer was a man who walked the counties through and through with a half-plate camera on a big tripod, and fitted with an R.R. lens. The slides were loaded with ordinary plates (or

at the most orthochromatic), and the worker (we nearly said labourer) felt lucky if at the end of the day, and after having humped his kit twenty odd miles, he had secured—two good landscapes.

To-day all is changed. Cameras are fitted with lenses of marvellous speeds and giving superb definition, and emulsions are provided that will render the countless greens of nature correctly instead of the one-time uniform black that we got in the "good old days." Filters can be used that will penetrate the distant

*Trees and Meadows.*

*The Road to the Farm.*

mist, and cameras are a tenth their one-time weight; while as for carrying a tripod, well, many workers do not know what such a thing is. One would have thought that landscape photography would have been more popular than ever, especially in these days of enlightenment on the joys of the countryside.

For this note we have looked through our own files and have found several negatives that we consider fulfil the conditions of a pure landscape. It is at once apparent that there is a different aspect in these prints

# LANDSCAPE Photography

in comparison to those we are accustomed to see. Picture-making of to-day uses the peculiar technique of the camera and its technical operations towards the making of an artistic creation. The modern worker understands the nuances of light and shade and moulds his subject matter to show this quality to the best advantage. This is not possible in pure landscape. The subject matter is Nature, with all the seemingly inconsequent scattering of her jewels on Mother Earth.

Landscape needs more than anything else an understanding if it is to be appreciated as it deserves, and this understanding is not a result of a training in art. The understanding one must bring to landscape is a love of Nature just as she is.

This love, it seems, is fast being submerged in these

*In the Chilterns.*

days of mechanism and machinery. A quiet, reflective mood is an essential, and then one realises when looking at the scene before him a sense of pulsating life. The vibrant air, the vital, unseen, unfathomable urge of existence going through the trees, the hedgerows, even the illimitable blades of grass.

Composition, design, or a main centre of interest is difficult to achieve with landscape. It will be found hard to tell a story and create an interest according to accepted tenets of art, so landscape has seemingly faded away in favour of subjects that illustrate more the efficiency of the materials used and the skill

*The Edge of the Wood.*

of the user rather than the merits of the subject.

Possibly one day, when the chemist has mastered the spectrum and gives us colour, landscape will once again come into its own.

*A painter's subject.*

# News and Reviews

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS

During the months of July, August and September, the Daimler Co., Ltd., of Coventry, are holding a photographic competition with attractive prizes, which will be awarded to the best "news" or "interest" pictures featuring Daimler or Lanchester cars. Full particulars will be forwarded free to any reader of "The A.P." on application to the Publicity Department, Photographic Competition, Messrs. Daimler, Ltd., 22, Old Queen Street, London, S.W.1.

Messrs. Ensign, Ltd., of 88-89, High Holborn, London, W.C.1, have issued a new catalogue giving full details of the Ensign Home Ciné cameras and accessories. This is very fully illustrated, and all particulars for the amateur cinematographer are included. A copy will be sent free on application to the above address.

"Cinema Quarterly," edited by Mr. Norman Wilson, is published quarterly at one shilling, and should be read by all who take the cinema seriously. There is a tendency to look to Soviet productions rather than to Hollywood, the Continent or Elstree for inspiration, and in nearly every number there will be something with which readers will disagree. This is all to the good. "Cinema Quarterly" is intended to make the reader think. In the current number articles of particular interest to the amateur film-maker include, "The Scenario," by Ernest Petts; "The Function of the Actor," "Subtlety on the Screen," "Scope for the Short Film," and "Scope for the Silent Film." The criticisms on current professional films could teach the ciné amateur a lot.

The popular lectures given by Mr. R. M. Fanstone on "Romsey Abbey, its history and to-day," "The New Forest" and "The Mother City of England," are again available for photographic societies without fee. Early application should be made to Mr. Fanstone, Romsey, Hants.

An error occurred in the description of the larger of the two "Speedex O" cameras in the Buyer's Guide of our recent Miniature Camera Number. This camera is not designed to take sixteen exposures on eight-exposure  $3\frac{1}{2} \times 2\frac{1}{4}$  roll film as stated.

The Western Salon of Photography, organised by the Western Counties' Photographic Federation, in affiliation with the R.P.S., is now open at the Pump Room, Bath, and remains open until Saturday, July 13th. All the classes were well supported, and over 300 prints and 100 lantern slides are on view. The exhibition was opened by the Mayor of Bath, and is proving a great success.

The "Contax" Exhibition, now open at 202, High Holborn, W.C.1, has proved so successful that the closing date has been extended to July 20th.

Many readers of Messrs. Ensign's advertisement of the Ensign Double-8 miniature camera in our last issue must have been puzzled at the statement that this attractive little camera took six pictures on V.P. film. Others who had read our references to it in a previous issue would have realised that a printer's error had been made and sixteen exposures was the correct number.

**Stolen.**—A Rolleicord Camera, from 25, Glazberry Road, Barons Court, W.14. The camera had Triotar f/4.5 lens No. 1480921, and was complete with lens caps and extra-long wire release, in Rolleicord leather case with shortened carrying-strap. Any information regarding this camera should be sent to Mr. L. W. Bennett at the above address.

A new revised price booklet has just been issued by Messrs. E. Leitz, Ltd., 20, Mortimer Street, London, W.1. This contains particulars of all the Leica models, lenses and accessories. The firm announce with regret that there is a slight increase in the prices of all Leica articles due to the rate of the pound sterling having been adverse for some considerable time. Our readers should write to the above address for a copy of this price list.

The Professional Photographers' Association Benevolent Society has issued a little booklet containing full particulars of this phase of activity of the P.P.A., and we can commend it to all our readers who are charitably disposed towards a good cause. A copy of the booklet will be sent free on application to the Secretary, Professional Photographers' Association, Sundial House, 357, Euston Road, London, N.W.1.

A prize competition for "Beauty-Snaps" is announced by the *Sunday Referee*. Any subject—indoor or outdoor—may be chosen, but artistic merit will be the first consideration. There will be weekly awards, and at the close of the competition there will be final prizes of £50, £25, £10, and fifteen of one guinea each. Full particulars are given each week in the paper itself.

## Exhibitions and Competitions

CURRENT AND FUTURE.

Notices of forthcoming exhibitions and competitions will be included here every week if particulars are sent by the responsible organisers.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers. Entries, July 31. Rules in the issue of June 26.

California Pacific International Exhibition, San Diego.—May 20–November 17. Particulars from Miss Ruth Kilbourne, Exhibition Headquarters, Balboa Park, San Diego, Cal., U.S.A.

Western Salon of Photography.—June 20–July 31. Hon. Salon Secretary, S. R. Lewin, 107, Shakespeare Avenue, Bath.

Lucerne Salon.—June 20–July 22. Secretary, International Kunst-photographische Ausstellung, Lucerne, Switzerland.

Lincoln Camera Club Annual Exhibition.—Open, July 5–28. Hon. Exhibition Secretary, J. H. Hutchinson, 44, Richmond Road, Lincoln.

Paris International Salon.—October 5–20. Secretary, M. E. Cousin, 51, Rue de Clichy, Paris.

Szeged (Hungary) International Salon.—August 4–21. Particulars from Secretary, Magyar Amatortykepek Szovetsege, Csoportonak, Szeged, Hungary.

Southern Counties Salon (organised by Camberwell C.C.).—August 11–31. Hon. Salon Secretary, W. Bertram, 45, St. Lawrence Road, Brixton, S.W.

South African Salon (Johannesburg).—Entries, July 26; open, August 26–31. Hon. Secretary, Johannesburg Photographic Society, P.O. Box 7024, Johannesburg, South Africa.

Amsterdam International Salon.—Entries, August 1; open, September 14–20. Further particulars from Focus, Ltd., Fotosalon, Bloemendaal, Holland.

London Salon of Photography.—Entries, September 4; open, September 14–October 12. Further particulars from Secretary, London Salon, 53, Pall Mall East, S.W.1.

R.P.S. Annual Exhibition.—Entries, August 16; open, September 14–October 12. Further particulars from Secretary, 15, Russell Square, W.C.1.

Irish Salon (to be held at Mansion House, Dublin).—Entries, September 14; open, November 2–9. Particulars from Hon. Secretary, Irish Salon of Photography, 18, Morehampton Road, Dublin.

Rotherham P.S. International Exhibition.—Entry forms due, September 23; prints, September 30; open,

October 16–19. Hon. Exhibition Secretary, E. George Alderman, Ruardean, Newton Street, Rotherham, Yorks.

Indian International Salon (promoted by Camera Pictorialists of Bombay).—Entries, October 1; open, November 17–30. Hon. Salon Secretary, F. R. Ratnagar, Central Bank Building, Fort, Bombay, India.

G.W. Rly. "Camp Coach" Holiday Competition.—Prize, one week's holiday in camp coach during 1936 holiday season. Photographs should depict any aspect of camp coach holiday. Entries due, October 31. Further particulars from Superintendent of the Line, G.W.R., Paddington Station, W.2.

Canadian International Salon, National Gallery of Canada, Ottawa.—November 6–21 and afterwards in other Canadian cities. Entries due, September 20. Entry forms and further particulars from Exhibition Secretary, Canadian International Salon, National Gallery of Canada, Ottawa, Canada.

Leicester P.S. International Exhibition.—Entries, January 24, 1936; open, February 24–March 7, 1936. Exhibition Secretary, H. Foscutt, 19, Doncaster Road, Leicester.

# But They're Fine!

SMITH: They're fine! But I can't believe it's your master hand alone, although it's true we use similar cameras.

BROWN: No, it isn't my master hand, but I'm sure it is my better choice of film.

SMITH: But surely it's only the camera which matters.

BROWN: Not the camera alone, but the combination of good camera and good film, the latter meaning Pernox.

SMITH: Are these from Pernox film?

BROWN: Yes, and that seems to explain the difference in our results, with maybe a touch of "The Master Hand."

## PERNOX ROLL FILMS

*Among other things the fine quality of negatives taken on Pernox film is due to its extreme speed, its good gradation and latitude in exposure, and also its very fine grain.*

**PANCHROMATIC PERNOX** has now been introduced to the British market and gives correct monochrome rendering of colours.

**ZEISS IKON LTD.,**  
11, Mortimer House, Mortimer  
Street, London, W.1

Shoot at sight with a

# Retina

Kodak's quick action  
miniature

£10.10.0

A fast lens and shutter are needed for "action" pictures, but the speed with which you can use them counts just as much. There's not a moment lost with the "Retina" because it has simplicity as well as speed and precision—a standard "Compur" shutter (1/300th or 1/500th sec.), spring opening front and ever ready tubular viewfinder.

Always ready to make needle-sharp snaps on the spur of the moment, this 36-shot, fast-lens pocket camera gives you miniature photography in its simplest and most economical form.

Ask your nearest dealer to show you a "Retina," or write for information to

Schneider "Xenar"  $f/3.5$  lens. "Compur" Shutter. Direct vision tubular viewfinder. Automatic exposure counter. Depth of focus scale. Daylight loading and unloading. Thirty-six exposures for 3/6. Kodak "Panatomic" or Super Sensitive Panchromatic Film.  
"Retina" with "Compur" Shutter (1/300th second) - £10.10.0  
"Retina" with "Compur" Rapid Shutter (1/500th second) - £12.0.0

# Letters to the Editor

*The Editor is not responsible for the opinions of his correspondents.*

## STAIN ON BATH.

SIR,—With reference to the query by G. E. L. (Barnehurst) in June 12th issue of "The A.P." I have found it a good plan to pour a weak solution of hyposulphite of soda (warm water) into the stained dish. This immediately dissolves the stain caused by the developer. Provided the dish is then thoroughly washed it will be quite safe to use for developing.

I have used this method quite successfully, but only for porcelain dishes, and cannot vouch for its efficacy with other types of dishes.—Yours, etc., L. N. WILLIAMS.

## WANTED—AN ENLARGER.

SIR,—I heartily endorse the remarks your correspondent "H. W." makes on the difficulty of procuring enlargers and other equipment for the 16-on-3½×2½ camera.

I, too, have one of these efficient and economical little cameras, but have searched in vain for an enlarger to suit.

On looking through the catalogue published by the manufacturers of my camera I got quite excited when I saw a post-card enlarger, but, alas! on closer examination I found it was for 16-on-V.P. size film only.

Also, it is quite impossible to procure printing paper for the 2½×1½ negative. It seems to me that unless the manufacturers of this size camera make some attempt to market suitable equipment to go with it, its popularity will decrease, and that would be a great pity.—Yours, etc.,

JAMES H. ENGLEDDOW.

## AN ENLARGER PROBLEM.

SIR,—In a recent number of "The A.P." I noticed a Reader's Problem about stopping down in enlarging. This raises a point in my own experience which may interest your readers. Some time ago I was using an optical lantern, fitted with a normal 7-in. projection lens, for projecting curves obtained photographically on to a screen for examination. In doing this I had occasion to stop down the lens to a small aperture, in which process I obtained a peculiar diffraction pattern similar to that shown. The lamp was a standard 500-watt Edison projection lamp with 5 vertical spirals as elements, the plane of the elements being perpendicular to the optic axis of the lantern. As good accuracy was required the system had been adjusted with some care. The iris diaphragm was immediately behind the back component of the lens.

It is easy to obtain a circular diffraction pattern with condenser enlarging by reducing the aperture, but I have never been able to explain or reproduce the above phenomenon. If any of your readers have had any similar experiences, or have a likely explanation, I should like to hear their views.—Yours, etc., E. E. M.

## SLOW "INSTANTANEOUS" EXPOSURES.

SIR,—In reply to Mr. F. Green's enquiry in the issue of June 5th, my Auto-range, as he surmises, has a Compur shutter. The focal-plane model was too heavy and bulky for my needs. One of my reasons for buying the Auto-range was to avoid the weight and bulk of my other cameras. Neither when it has been fitted to the Auto-range nor to any other camera that I have ever used has the Compur exhibited the "kick" which Mr. Green mentions. Moreover, I am sure that a shutter so famous and so widely used by so many makers for so many years would long ago have had such an obvious fault remedied.

In point of fact, by half turning my body, resting the camera on my shoulder in the Press photographer fashion, and employing the direct view-finder, I have successfully taken shots "landscape" way up at 1/10th sec. without a trace of blur.

Further, I find this manner of holding the camera particularly satisfactory for gaining the maximum benefit from the range-finder itself. So far, I have not discovered quite such a convenient method of holding for "upright" photographs. A simple wooden handle to screw into the tripod socket will, I think, solve the problem.

May I add that my Auto-range has never yet delivered me a blurred negative.—Yours, etc. BM/ZVTW.

## EXPOSURE METERS.

SIR,—With reference to A. J. Bailey's letter under the heading, "Exposure Meters," commenting upon the exposures of two Leica cameras, one (A) 1/40th at f/6.3, and the other (B) 1/200th at f/4.5 with an ×3 filter.

He calculated that the two exposures are very nearly the same, but I think he has misunderstood the ×3 filter. It is agreed that f/6.3 requires twice that of f/4.5, and therefore (B) would require 1/100th at f/6.3. Quoting from Mr. Bailey's letter, he says "Therefore (B's) exposure would be 1/100th at f/6.3, and as he used an ×3 filter his exposure would be 1/33rd." That is not quite correct. As he used an ×3 filter his exposure would be 1/3rd of 1/100th, which is 1/3rd × 1/100th = 1/300th, not 1/33rd.

Thus the exposures were as 1/40th to 1/300th, or 7½ to 1. Here is another way. Take it from (A's) viewpoint. (A) exposed 1/40th at f/6.3. Thus at f/4.5 he would expose half of this, or 1/80th. With ×3 filter he would multiply by 3 = 1/80th × 3 = 3/80ths, or about 1/27th, compared with (B's) 1/200th. The ratio is therefore 27 to 200, or 7.11/27ths to 1. This you will notice is almost identical with the ratio obtained before.

Hoping this will show A. J. Bailey where his mistake was.—Yours, etc., S. L. CARTER.

## WHY NOT AN "A.P." CLUB?

SIR,—May I again take the liberty of asking for a few more lines of your space in favour of the "A.P." Club?

Mr. Deacon's letter certainly strikes the right note, for it is time that a few amateurs co-operated in this idea and began to do something. Mr. Willatt's excellent suggestion has been in the air and under discussion long enough, and unless it is put upon a concrete base quickly will probably die a natural death. To prevent this I am willing to add my name to that of Mr. Deacon as one who is willing to meet or hear from others with the object of drafting a scheme for the editor's approval. Photography often calls for grit and determination under difficult circumstances, so let us apply this same determination and push this scheme through with flying colours.

Following Mr. Deacon's example here is my address: 12, Macready House, Crawford Street, London, W.1.

I can only conclude by hoping that photographers will not let this scheme rest where it is.—Yours, etc.

B. SUGGITT.

SIR,—Regarding Mr. Willatt's suggestion for an "A.P." Club, I believe it would be a useful "ice-breaker," and brighten many a dull day.

I would point out that if every photographic society adopted a badge a somewhat similar purpose would be served; but the advantage of an "A.P." Club would be that the badge would be universal and easily recognisable. Wearing of it could even be interpreted as "speak to me."

I can endorse the "get together" opinion expressed by your correspondents, and I can affirm having had a hearty reception when I have introduced myself to outing groups of other societies whom I have met in distant parts. I can foresee such a club helping to increase the membership of photographic societies generally. I have planted the seed many times in a casual meeting, even to telling my chance acquaintance his two nearest societies, with names and addresses of secretaries.—Yours, etc., T. D. NUNN.

# A Camera at the Paddling-Pool

By RONALD GOODEARL.

THE photographing of children is recognised as one of the most fascinating branches of the pastime, and no one can fail to be attracted by a picture of children enjoying themselves. Some people however, not having children of their own, may be at a loss to know how they can find suitable subjects. A visit to the local paddling or yachting pool on a fine day should solve their problem. Here children of all ages will be found happily disporting themselves, and the camera enthusiast will find it difficult to avoid firing off all his plates or films during the first few minutes. It is best, though, to restrain this impulse or valuable material is likely to be wasted.

The camera should be employed as unobtrusively as possible, or the photographer will probably find himself the centre of a crowd of small boys requesting him with a loud voice to "Take our picture, mister." Perhaps the best method to employ, particularly for those not used to working in crowds, is to find a seat at the side of the pool and work from this. Of course, in taking up a position the direction of the sun and the suitability of background should be carefully considered.

When using a camera focussed by scale the shutter and lens aperture should be adjusted ready for action,

*A serious occasion.*

and then when a subject presents itself the distance can quickly be judged, the scale set, and the shutter released. Do not be in too great a hurry to make the exposure unless the subject is an exceptional one, for children playing will in time assume most delightful poses, and it pays to wait.

If it should be found necessary to

pose the children they should not be allowed to stand still, or the chances are that they will be very self-conscious. Ask them to start at the far side of the pool and run towards the camera. The focussing scale should previously be set at, say, fifteen feet, and the shutter released when they reach this distance. Of course, a lower shutter speed will be used for still subjects. Another method of posing is to arrange a "splashing contest," which will cause great enthusiasm.

Several interesting pictures should be secured in this way, although the photographer would be well advised not to work too close to his subject, or he may find himself receiving a deluge of water which will not improve the camera or the appearance of his clothes.

Sometimes good pictures are obtainable by patient stalking. Striking pictures which are not obviously posed may be worth entering in one of the numerous competitions, especially if the pictures tell a story.

In the very nature of things most of the subjects will include a considerable number of figures—the paddling-pool is crowded with life and movement. But the more figures the greater the risk of one or more being unsatisfactory, and attention should also be given to carefully selected and isolated groups of two or three.

*A showerbath for one.*

# how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCLXXXIX.

Mr. A. C. R.  
REDGRAVE.

From information communicated to our Special Representative.

"JUST over two and a half years ago, at the age of twenty, I first ventured into the realm of pictorial photography. I sent a few slides to *The Amateur Photographer* annual slide competition and one was selected for purchase. This initial success was followed by the acceptance of a print at the Central Association first annual exhibition at Russell Square. Since then I have contributed prints to a large number of exhibitions all over the country, and find this sort of thing helpful and interesting. "I have a marked preference for subjects showing a strong contrast of sunshine and shadow, and seldom make an exposure on a dull day except for record purposes. On analysis of my prints it seems that

the most suitable scenes for this type of picture are to be found in the streets and out-of-the-way corners of quiet towns and villages; but nothing comes amiss to me if it has a strong sun pattern. Although I have a great admiration for soft, misty landscape pictures I have not yet succeeded in producing one that satisfies me, but I am living in hopes.

"As regards apparatus I have two cameras, a  $3\frac{1}{2} \times 2\frac{1}{2}$  Zodel and a T.-P. reflex of the same size, which has a 9-in. telephoto lens interchangeable with the normal 5-in. lens. My enlarger is of the vertical type and is home made; apart from the camera used on it, this cost only a few shillings.

"I use nothing but Soft Gradation panchromatic plates and Selo

Hypersensitive film, with or without filters, of which I have a variety. I develop mostly in a dish by time and temperature, using the maker's M.Q. formula; but as my subjects are contrasty I cut down the time of development considerably. This procedure gives the kind of negative I like—thin, with a reasonable amount of contrast, and plenty of detail.

"My prints are mostly made on chloro-bromide paper—'Kodura' or 'Mezzotone'—and I have tried various developers with success; but I now use either 'Kodura No. 3' or Chlorquinol. In cases where the negative is not suitable for chloro-bromide paper I use Kodak Royal bromide and develop in amidol:  $\frac{1}{2}$  oz. sulphite, 30 grains amidol, 12 oz. water, and no bromide. I have also made a number of bromoil prints for exhibition purposes.

"I am not a photographic purist at heart, and when necessary I do as much handwork on the print as I can conceal, and after steaming I rub a 'dope' mixture over the surface of the finished picture.

"I have found membership of the local society and a Postal Portfolio a great help, and believe that much can be learnt from the spirit of friendly criticism and advice which prevails in such clubs. I have been a regular reader of *The Amateur Photographer* for some eight or nine years, and I have always found the articles and criticisms of assistance to me both as a beginner and later as a more advanced worker."

(A further example of Mr. Redgrave's work will be found on one of the centre Art pages.)

CORFE.

A. C. R. Redgrave.

# Pictorial Analysis

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

## "THE KENNEL MAID," by B. Kentish.

PARTICULARLY happy in its effect of sunshine, and notable for its feeling of air and space, this picture is also characterised by a very strong form of composition in which the basis is that of the pyramid.

There are points of similarity between it and the subject of our discussion last week, in that both show the figure silhouetted against the sky; both are instinct with the glow of the sun shining from a low altitude, and, in each case, the foreground is but a simple strip of deeper tone sufficient to fulfil its function of carrying the greater interest above.

Here, however, there is not the same suggestion of movement, nor, in the nature of things, would it be desirable; but, while the subject has been caught at a still moment, there is yet a feeling of power held in restraint, and, in its way, it is no less effective. The sky is not quite so forceful, nor are the cloud forms by any means so insistent; but, nevertheless, they suit the subject, and, in view of its rather bigger scale, a marked cloud effect would be inappropriate, as it would diminish the interest which should attach to the group.

This being more prominent, the setting is less significant and does not require to be so assertive as in the former instance. It is very nicely judged, and forms a perfect foil for the group, which, with its effect and force of arrangement, is able to stand alone and without embellishment.

Concerning its formation, the shape of the pyramid is shown in the sketch by dotted lines. It will doubtless be observed that the form is indicated rather than faithfully followed, for, in composition, as in most other things, to state the obvious is trite, and it would not do for the formation to be so plainly in evidence that it drew attention to itself. If it did, it would defeat its object. The idea is that the arrangement should show the pictorial motive in a way that is

intelligible, and to do so it must display a sense of order.

The pyramidal form is simply one of a number of recognised arrangements that embody the required sense of order, and it is sufficient if, in the layout of the subject material, it is roughly followed rather than slavishly adhered to. It should be an indication rather than a definite shape. In

The figure of the girl naturally assumes pride of place as the chief centre of interest. The attraction of the human element is partly responsible, but that is emphasised both by her position in the picture space—just off the centre—and by the fact that her head comes just at the apex of the pyramid. Other things being equal, the apex is the strongest point of the formation, and it therefore follows that what it contains is endowed with significance.

Besides this, the light on her face and the dark of her coat provide the greatest contrast of the whole picture. This, again, causes a concentration of interest, and, where there are so many factors working to the same end, her dominance is unquestionable, and the necessary feeling of unity is achieved.

Of subsidiary importance, but holding their place in the scheme, the foremost pair of dogs (2) come next. They attract more of the attention than the other three, partly because of the light on their foreparts and partly because of their position at the angle at the base of the pyramid. The fact that they are foremost, too, counts for something, and the more subdued tone and less assertive position of the remaining three indicates their place as of lesser consequence.

The pair and trio fall to be considered as such by reason of the fact that they

are so placed in the picture. There is a close connection between each element of the two groups, and there is a space or interval sufficient to separate them. The tail of the pair and the leashes join up both groups with the figure, and this connection stresses the sense of unity which is acquired by the dominance of the figure.

Altogether, the arrangement falls together extremely well, and, had it been deliberately arranged, it is doubtful if any useful alteration could have been successfully made. "MENTOR."

this instance, the heads of the dogs on the left project beyond the dotted line; the head of the next is within it, and the head of the girl comes at the apex. On the other side, the line runs through the hindquarters of the animal on that side, and, as for the base, it roughly follows the crest of the hill. There is nothing definite about it except the apex, and that, with the girl (1) as the dominant factor of the picture, is necessary. All the rest just happens to fall into a rough approximation of a pyramid.

# PICTURES by Novices

## SOME CRITICAL COMMENTS on the *Beginners'* prints reproduced on the opposite page

"FOUR WENTS POND," by John Stirling—No. 2 of the prints reproduced on the opposite page—is a nice little landscape of the pastoral type; it has a nice atmospheric suggestion about it; its lines fall very pleasingly, and the group of cows forms an appropriate element to serve as the centre of interest.

### Decision in Landscape.

All these are excellent points; but, without wishing to depreciate their value or to minimise the attraction the work undoubtedly possesses, it must be admitted that it just misses that decisiveness which would turn it from a good thing in its class to an exceptionally good thing.

With the composition there is little to criticise. A fraction more on the left would not be disadvantageous, and something might be taken from the right, but this is not a matter of any great moment. The suggestion of mist furnishes an adequate pictorial motive, and, if it has not the vitality and life that sunshine confers, it is quite a good substitute. The grouping of the cows might, perhaps, be a little more fortunate in that a side view of the one on the right would be better than a three-quarter rear view; but it is not this that is responsible for the feeling of indecision.

Nor is it the definition. It is not all that it might be, but it is tolerably acceptable, and it seems that the lack lies rather in a sort of deadness or lack of light in the representation.

Something is lacking in the quality of the print from which the reproduction was made. For one thing, it seems to be deficient in vigour, and, for another, it does not seem as luminous as it might be. The first might be corrected by the choice of a slightly more vigorous grade of printing paper, care being taken to see that it is fully developed, but the second calls for an alteration in the tonal values.

### Control and the Subject.

If, for a moment, reference be made to the sky of No. 3, "The Mills, Bruges," by John R. K. Pirie, it will be seen that there is a distinct difference between the tone of the sky near the horizon and along the top. It is the blue of the sky that is in question, and the presence of the clouds may be disregarded for the time being.

This difference in tone corresponds to the distinction in depth between the sky in its upper reaches and towards the horizon, there being a gradual lightening from the first to the second.

Assuming always that the landscape has sufficient weight, a like distinction in the print conveys a sense of light and luminosity, and it is this that "Four Wents Pond" seems to lack. The dark tone of the cows does something to provide the landscape with the required weight; but it is not quite enough, and, if the change in printing paper does not give the added depth of tone that is needed, the immediate foreground should be artificially deepened.

Both of these adjustments could be managed by the exercise of a measure of control during printing. A little extra exposure to the top and base, the middle of the print being shielded by a mask, would, provided the mask were kept in motion so as to soften the edges and to prevent the device becoming apparent, impart the desired extra depth at base and top.

### The Sense of Light.

If properly done, and not carried too far, the adjustment would provide just that sense of light that the print seems to need. A little experiment, no doubt, would be necessary before the degree could be definitely determined; but it would be well worth while, and, in the end, the print would gather that feeling of decision in which it is now unfortunately deficient.

Turning again to No. 3, the blue of the sky does show a highly desirable degree of modulation, but the clouds are rather detached in form, and not too happy in their shapes. Moreover, they are too insistent for their place in the scheme, and do not afford a sufficiently quiet setting for the nearer mill.

If the foreground were also darkened along the base, it is quite possible that a sky without any cloud at all, but with an equal measure of gradation in the blue, would prove a much better setting for the subject. It is true that such a sky did not exist at the time of the exposure, and it is probable that its desirability was not foreseen; but, if it had been, a little waiting, or another visit, might have produced the desired conditions, and

then the result would have been infinitely preferable.

### Distinctions and Differences.

No. 1, "Sentinels," by Denis Singleton, does show this sense of light to a not inconsiderable extent. The sky is darker towards the top than at the horizon, though in this instance it is graced with light but unobtrusive clouds.

The dark of the trees, together with the depth of tone in the foreground, helps it out; but, on the other hand, there is rather a hard line for the horizon, and the two trees seem to need a third to give them balance. Compared with No. 2, and although it has not quite the same subject value, the print has decision, and, technically, it shows the better workmanship.

In No. 4, "The Brothers," by Robert Welburn, there is, again, an impression of luminosity, though here it arises from the light on the water rather than from the sky. Actually, the strip of sky is the lower in tone, and the feeling is not only aided by the distinction, but is stressed appreciably by the darks of the figures coming against it. The effect is nicely seen, but the out-of-focus figures in the distance are something of a drawback and lend a touch of indecision that the picture would be better without.

### Definition and Clarity.

There is also some loss of definition in the two nearer figures and the immediate foreground. This may be due to incorrect focussing or movement of the camera or subject during the exposure. Either defect should be carefully guarded against, for, apart from anything else, it is a bar to enlargement, and that is practically essential if a print is intended for exhibition.

No. 5, "The Loft," by W. Titley, is better in this respect, and the feeling of glancing sunshine is quite charming. It would, however, be heightened if a figure could be introduced on the balcony where the two walls meet; and No. 6, "A Highland Loch," by J. A. Stirling, could do with a strip of foreground below the water, and would gain in luminosity if the light of the cloud at the top were removed.

"MENTOR."

# With the Beginners

## NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

### VERTICAL OR HORIZONTAL.

IT is just as well to state first of all what I mean here and now by the words "vertical" and "horizontal," as I am using them in one particular sense only. In an excellent textbook I find the expression "oblong or landscape way," and I do not think this is correct. An oblong is a rectangle longer one way than the other. Figs. 1 and 2 are both oblong in shape, but the long sides run in different directions, and I am going to call Fig. 1 vertical, and Fig. 2 horizontal.

As to the expression "landscape way," this has come to be recognised as referring to a rectangle positioned

like that in Fig. 2, although, of course, many landscapes take the form and direction of Fig. 1, which is sometimes called "portrait way," although here again the term is rather loose.

If a photograph is bounded by a square or circle its dimensions are the same either way; but in spite of the growing use of square *negatives* the fact remains that the great majority of *prints* are oblong. If the longer sides run from top to bottom I am calling the oblong "vertical"; if they run from side to side I am calling it "horizontal."

A few cameras are specially designed for taking horizontal subjects, although the vertical form can be secured less conveniently. But the majority of cameras are adapted for either form, either by the use of a reversing or revolving back, or by turning the camera bodily through an angle of 90 degrees.

Some cameras can be more comfortably held and manipulated in one position than in

the other, and it is evident that their users are inclined to let this influence the form of their picture. This should not be so. The aim should always be to arrange the subject one way or the other according to how it will fill the picture space most effectively.

We are told that horizontal lines and masses tend to suggest repose and calm; while a vertical predominance suggests dignity and height. There is something in this, but it must not be accepted as universal or even general. There are numerous exceptions in both cases. But I should say that in nine cases out of ten it is a fairly easy matter to decide straight away whether the vertical or the horizontal form better suits a given subject.

In taking Fig. 1, for example, the vertical way would be selected without any hesitation. But if the tomb in the foreground had been made the subject it would be equally natural to adopt the horizontal way. This is not so much because of the idea of dignity in one case and peacefulness in the other, but because of the dimensional proportions of the two subjects.

Fig. 2 just as naturally "settles"

Fig. 1.

Fig. 2.

Fig. 3.

into the horizontal form. The pinnacle and the bows of the King's yacht decide the matter themselves.

When it comes to Fig. 3 there is room for thought. The print as it stands shows what it was intended to show, but it is evident that on the left,

in the middle, and towards the right there is material for vertical treatment. I made several records at this spot, and certainly the best of them (such as they were) assumed the upright form.

It is often possible and easy to get

a vertical composition out of part of a horizontal negative, or a "landscape way" subject out of a vertical one. But this is not my point at present. I am urging the beginner to consider, before making an exposure, which way he shall take the subject. Sometimes he neglects this important consideration altogether; he may even have slipped unconsciously into the habit of using one form in preference to the other. Perhaps there is some subtle attraction about the square negative, because there is no right or wrong, or better or worse, about it.

This is not the case with the oblong negative, and it is dangerous to rely on being able to rectify matters afterwards. As likely as not it cannot be done. We often see a print, for example, of about the shape of Fig. 3, with a single upright figure in the middle of it. This looks absurd, and indicates lack of the very foresight I am advocating. An attempt to make a vertical rendering of the figure may show that there is insufficient foreground or space above the head. In fact, it is just as likely as not that the lower part of the figure runs out of the picture-space altogether.

W. L. F. W.

## "DELAYED ACTION"

By  
H. F. HANDS.

MANY of the more expensive shutters are fitted with a "delayed action" feature which can, at the option of the user, be made to release the shutter approximately fifteen seconds after the trigger is pressed. It is doubtful whether the majority of amateurs possessing these shutters are fully aware of their possibilities.

Self-Portrait, 1 sec. at  $f/4.5$ , delayed-action Compur shutter.

Apart from the obvious application to self-portraiture there are many occasions when the inclusion of a figure in a landscape would be the making of a picture. Even when a photograph is

taken for record purposes without any definite pictorial end in view a figure gives scale to the scene and enables the dimensions of the other objects to be appreciated. When the photographer is alone, and there is no fortuitous person in sight, the delayed-action shutter enables the photographer to provide the human interest in the picture.

Having set up the camera on the tripod and released the shutter, the photographer walks or runs to the chosen spot and waits until the shutter is operated by the automatic mechanism. It is important to avoid any appearance of posing or self-consciousness, so he should on no account look straight at the camera, but be looking towards the main feature of the picture. A back view is frequently suitable.

For those who do not possess this type of shutter there is available a little instrument known as a "self-timer." It is obtainable from photographic dealers, and costs only a few shillings. It consists of a clockwork device which fixes on the end of the ordinary cable release, and after being wound up releases the shutter. A lever on the side locks the mechanism until all is ready, and the time delay can be varied according to the amount the winding-key has been turned. A more expensive model has an arrangement for making time exposures as well as instantaneous.

A word of warning may not be out of

place. When using a shutter in this manner do not forget to wind the film on as soon as you get back to the camera.

On Sty Head Pass, 1/50th sec. at  $f/11$ , taken with self-timer.

# Picture Points for Beginners

by "RICARDO"

Grouping in "Still Life."

IN the first of these two sketches several bad faults which continually occur in beginners' prints have been made. The vertical dotted line shows that there is no unity between the subjects, and could, therefore, be trimmed into two prints. Taken as a whole, however, the coffee-pot spout is leading out of, instead of into, the picture, and is also shown exactly broadside on, another fault. Further, if a cup and saucer must be shown in the same picture as fruit, be definite about it and show its greater portion; never cut in half, as shown, on the edge of the print. Regarding the bowl of fruit, it is far too symmetrical, and offers no variety of shape or contour. Try and aim at "studied carelessness" rather than for studied carefulness. It will suggest natural grouping and be more pleasing. Notice, too, how the bases of the three subjects are in one monotonous level, as shown by the dotted line. Compare this with the other sketch (below), which is offered as a suggested alternative. The grapes here are purposely placed to link the two halves together.

Watch also for the contrast of tones between base and background. The top sketch has a violent contrast of tone which terminates in a hard, ugly line across the picture.

It is better to soften this edge, also indicated in the flower group on this page; otherwise it tends to divide the picture and attract attention.

Reflections  
in Water.

WHILE reflections in placid water may seem very picturesque and pleasing, pictorially speaking, they are weak, particularly when the water is like a mirror and is half-way or thereabouts between the top and bottom of the print. This is because the interest is divided between the subject and reflection, and is consequently continuously wavering between the two.

This does not mean that all reflected subjects are weak. In the example shown the best picture would be the reflections after the water had been agitated in some way. If you throw a brick into the water let the centre of the splash be outside the picture, otherwise it will be obvious how the broken water was secured. In the case of a lake with mountain scenery it is better to decide at the moment of exposure which is the more interesting of the two, and then expose with the lake edge high up or low down in the picture.

Flowers in "Still Life."

FLOWERS are always popular subjects for still-life groups, but, in common with other subject matter, grouping plays an important part. In the first of the two pictures the flowers have been mixed without any regard for massing of similar tones and creates the effect of crowding. The vase is ill-chosen for the subject, because of its height and its confusing pattern work. If the flowers are to be the *motif* then they should be much lower down into the picture, not "just included," as the trimming suggests. Placing a few blossoms on the table always seems to be essential in flower studies, but if it has to be done, always see that they do not appear small and insignificant beside the main bunch.

The second sketch shows the strong effect of simplifying the number of types of flowers, and how a suitable vase or bowl does not compete for attention, but, because of its shape, stabilises the whole scheme. The flowers on the table, too, take a part in the picture, and do not look "lost or strayed from home."

The "Follow Through."

WHEN making a picture of mountain scenery, generally in itself bleak and bare, it becomes more essential to pick out some *motif* to hold the interest. If a roadway can be found try and find a suitable viewpoint where the path can be traced more or less continuously. If sudden breaks are made like those indicated with a cross, it creates a staccato effect and spoils the direction or rhythm of the "follow through." Compare it with the second picture and see how the uninterrupted line takes the eye "easily" into the picture. Whenever such roads, paths, and brooks, etc., are of major interest, it is desirable to get variety of direction and width, etc., in order to make them as interesting as possible.

# The camera for the discerning amateur

Ask your camera dealer to show you a Super Ikonta. You will realise instantly that the Super Ikonta corresponds with your ideal of a camera. It opens as quick as lightning and it will take good pictures every time—good because you know beforehand that the ingenious distance meter will make sharp pictures certain; in fact, the Super Ikonta is the camera which does the focussing.

## SUPER IKONTA

The Super Ikonta is made in the following four picture sizes, to take standard roll films:

### No. 530

$2\frac{1}{4} \times 1\frac{1}{4}$ , 16 exposures on usual  $3\frac{1}{4} \times 2\frac{1}{4}$  film.

### No. 530/2

8 pictures  $3\frac{1}{4} \times 2\frac{1}{4}$  or 16  $2\frac{1}{4} \times 1\frac{1}{4}$  divided.

### No. 530/15

8  $4\frac{1}{4} \times 2\frac{1}{2}$  pictures or 16  $2\frac{1}{2} \times 2\frac{1}{2}$  divided.

### No. 530/16. New Model

11  $2\frac{1}{4} \times 2\frac{1}{4}$  pictures on usual  $3\frac{1}{4} \times 2\frac{1}{4}$  spool.

Prices from £14 7 6.

and  
the film  
for best results . . .

ZEISS  
IKON

## PERNOX

All Super Ikontas take any standard make of roll film, but preference should be given to Zeiss Ikon Pernox film on account of its extreme rapidity, which enables "snaps" to be taken even in the evening or in dull light. The Pernox film has a super coating over the sensitive emulsion, giving perfect protection from scratches and blemishes.

Most good camera shops stock the Super Ikonta. A copy of our new fully-illustrated 80-page catalogue will be sent for cost of postage, 3d.

**ZEISS IKON LTD.,** 11, MORTIMER HOUSE,  
MORTIMER ST., LONDON, W.1

THIS EXPERIENCED PHOTOGRAPHER SAYS—

**THE PHOTRONIC CELL.** When you buy a Weston Meter you are making a permanent investment. The Weston PHOTRONIC Photo-electric cell or "electric eye" is permanent in its quality and efficiency. It does not vary with age, and even when subjected to bright sunlight it is not harmed. It is practically everlasting. £6:15:0 is not much to pay for an instrument which will give you scientifically accurate exposure readings of proven permanence, for as long as you are ever likely to want them. A users says, "Upon correct exposure rests a major part of success in photography, and to that end I would advise the very best exposure meter, the Weston."

**PRICE REDUCTION.** Weston Universal Exposure Meter for "Still" and Ciné Cameras, now only £6:15:0 cash, or on easy payments, 15s. 9d. monthly.

## NEW ZEISS IKON PRECISION TWIN - LENS REFLEX IKOFLEX ●

The Ikoflex is a beautifully-made twin-lens reflex which gives brilliantly crisp pictures of the highest precision quality. A new departure is a special Zeiss condensing lens underneath the ground glass gives brilliant viewing and illumination right to the very corners of the picture. The camera is built from a die-cast body that will last a lifetime and will not damage or dent if accidentally dropped. The price is a most compelling low one, and all unique twin-focus reflex features.

Specification.—Die-cast body, helical focussing, self-erecting hood, black leather inlaid covered, automatic film winding, compensation for paralax, depth-of-focus scale, large finder lens, magnifier in hood, and fitted with various lenses below.  
Zeiss Novar f/6.3, in Ikoflex shutter ..... £6 10 0  
Zeiss Novar f/4.5, in Ikoflex shutter ..... £7 10 0  
Zeiss Novar f/4.5, in New Compur ..... £10 2 6

A new Mirror Reflex at a Second-hand Price.  
● Get yours now. Write to-day. ●

## MOVIKON, with Coupled Distance Meter

The new Zeiss Ikon Camera with precision features and coupled range-finder focussing. The amateur has long envied the professional cameraman, with all the refinements that go to make perfect focus and clear pictures. The Movikon now available has all these features, and many others that will give you pictures of professional sharpness and quality.

● The Perfect Cine Camera. ●

£98:10:0

Immediate Delivery. No Quibble Exchanges.  
Hire Purchase Terms.

## SOUND ON FILM. THEATRE BRILLIANCY. THEATRE POWER.

16-mm. Ampro New Sound Projector, large lens, 750-watt direct coiled-coil illumination, lamp built in patent venturi tube (passing every iota of light through condensers), large booster reflector and lamp capped, 20-watt full cinema output (giving small sound or work a standard cinema speaker with full volume), speed adjustment to run own silent or talking film, jack

for microphone or gramophone to put sound to own silent films, high-speed rewind, take sound or silent films, unique flickerless shutter, synchro-mesh silent gears, unique "kick-back" claw action (no wear whatever on films), centralised controls. All bronze ripple, valves, speaker in two light portable cases. Full theatre sound for schools, cinemas, or hall, or can be tuned to a whisper for home use. Beautiful reproduction with the highest power on the market. Complete

EXCHANGES. £175 HIRE PURCHASE.

## NEW T.-P. COMPACT REFLEX

3½ × 2½ T.-P. Reflex, very small and compact, Dallmeyer f/4.5, latest self-capping 1/10th to 1/1,000th, full-size hood, long extension, sky-shade, revolving back (taking horizontal or vertical full-size pictures), automatic erecting hood with direct finder built in, all inlaid, will take plates, cut films roll films, film packs all perfectly. Telephone, etc., interchangeable. Very small and compact. Give pictures of the full-size popular 3½ × 2½ size. "The Perfect Reflex." £14

## "EGOFIX" SUPER SCREENS

"Egofix" Super Projection Screens, new patent process of blue-white-green crystal beaded surface of the most minute quality, blended to a rich actinic smoothness, reflecting every iota of light.  
40 × 30, on rollers, 45s. 0d. 50 × 40, £2 17 6  
40 × 30, Auto. metal hanging case ..... £3 5 0  
50 × 40, metal, £3 17 6. 60 × 45, £7 15 0  
40 × 30, leather auto. erect. wood ..... £4 17 6  
50 × 40, £5 17 6. Others to 10 ft.  
7 Days' Trial. Post Anywhere.

★ ★ WANTED—Cameras in exchange for latest New Models. Definite Allowances. All Makes supplied immediately. Hire Purchase. Every Latest New Camera (any make) supplied by ourselves is sent with our Free 6 Months' Personal Guarantee. By filling in the printed guarantee form supplied with every new camera, you are automatically covered against any possible defect or any fault whatsoever.

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

## Better Holiday Films By PATRICK LE ROI.

**J**ULY and August, the two great holiday months, are with us again, and it is at this time of the year that amateur film makers get really busy. The object of this article is not to offer any advice on handling the ciné camera during holiday time, but rather to discuss the ways and means of making our films more interesting both to ourselves and to others.

### Advantage of a Scenario.

The nature of our film will naturally depend upon the type of holiday we decide to take. Some of us travel aimlessly through the countryside by motor car, others prefer to spend a peaceful two weeks on a farm, while the rest choose the delights of the seaside.

In every case there is an overflowing amount of material for the enthusiastic amateur movie maker, who will find that a greater amount of success can be obtained if he spares a few hours roughing out a scenario before he, or she, goes away. Of course it will be quite impossible to include everything we wish to photograph in such a scenario, as more often than not quite a lot of unexpected subjects crop up which fit nicely into the picture.

Our scenario should be more in the form of rough notes and "reminders" which will help us to work out the *character* of the film. Let us suppose that Brighton is to be the happy hunting-ground. Now, what are the characteristics of the place? A large, busy seaside town—crowds of people, young and old, rich and poor, all full of life, enjoying the amusements the town offers them. If that is the impression Brighton gives us, our film must give others the same idea.

Many amateurs make their films too personal—scenes of the family and friends should of course be included, but not too frequently, especially if the picture is to interest others outside the "family circle." Comparisons in filmatic art always arouse interest. A scene of an ocean liner, plugging her way through the waves, followed by another scene of a small child sailing a toy boat in a pool of water are worth-while subjects.

Holiday films lend themselves to unique treatment and offer an unlimited amount of scope for the ambitious amateur. Character studies can always be seen in large, busy places and are invaluable to this type of film. Each scene should be full of movement and short in length; the more scenes you expose the more interesting the picture will be. Long-shots should only be used to convey the atmosphere of the place, and their number should be limited, as they are apt to become tiring to the eye and brain. Scenes should depict *individuals* rather than a mass of people, but it is essential that each scene, no matter how short, should show people full of life—enjoying themselves!

So far we have only dealt with seaside pictures, but those who choose to spend their holidays in the country will find just as many interesting subjects, but of a different nature. Life

in a small village is not so brisk as that in a large town such as Brighton, and therefore the *tempo* of our picture must be slowed down accordingly. Long-shots will become more general, because we are now dealing with the characteristics of the countryside rather than of its people. At the same time we must remember that we are still making *motion* pictures, and include some action which should be in keeping with the character of the surroundings. Men working in the fields, farmers busy about the farmhouse, animal studies, etc., would fit in beautifully, but it should be noted that scenes should be just a little longer, as we are aiming to depict the *peacefulness* of the countryside.

### The Importance of Editing.

The holidays over, we return home again, our reels come back to us, having been processed, and after a

A "new-angle" view of a game of bowls on the sands. The short focal length of the ciné camera enables this to be done easily and present a novel effect when seen on the screen.

"run through" on the projector we announce the verdict. Some shots have turned out better than we hoped, while others have proved rather disappointing; but on the whole the results are quite good, and now comes the job of editing. Unfortunately, most amateurs do not fully realise the importance of careful editing; in fact, a film can be "made or marred" by the cutting alone.

Editing does not simply mean arranging scenes in their right sequence

and cutting out "dud" bits of photography, but putting *rhythm* into the picture. In the case of our Brighton film sequence is not of great importance, but it is essential that it should go "with a swing," each shot being cut as short as possible without appearing jerky on the screen. A few well-chosen long-shots should be used to start the picture off, and then the others should be worked in showing contrasts and comparisons.

Film editing can only be taught by

experience, and the serious amateur will do well to study the work of others, both amateur and professional. The other type of film, country life, is perhaps a little easier to edit, and in this case continuity will help. Long-shots may be used all through the picture, while the length of each scene will depend upon the interest it contains. In every case a well-edited film should run smoothly and contain a few titles—the picture should be able to tell the story.

## Telephoto Technique for Ciné Workers By SIGURD MOIR.

Provided they are not affected by distorted perspectives, telephoto shots can be amongst the most expressive in amateur cinematography. The following article discusses the subject from the point of view of the practical worker.

**N**ORMALLY, the lenses used in sub-standard cinematography are of an extremely short focus. In some cases, focal length is measured in millimetres only, whilst in the majority of others it does not exceed a bare inch.

The effect of this is to deepen the "field" of the lens—or, as it may be put, to reduce focussing errors to a minimum. At the same time, a valuable device known as selective focussing is made practically impossible at any but the largest of lens apertures.

Fortunately, the lenses referred to do not occupy a great deal of space, so that it is no difficult matter to add telephoto and other lenses of longer focus to existing equipment. In this way, too, the cinematographer is enabled to obtain large-scale images from normal viewpoints, and to enjoy other advantages that have to be experienced to be appreciated.

### Focussing.

With the majority of long-focus and telephoto lenses, it is quite an easy matter to indulge in the luxury of selective focussing. Indeed the difficulty with such lenses is to avoid obtaining a general effect of diffusion—with sharpness of detail showing upon any plane but the right one.

The proper procedure for avoiding such troubles is to apply a little more time in correct focussing. In the correctly-focussed image, the most clearly-defined

plane should be that in which the major action is located. All other planes should be in more or less obscured detail—though, of course, they may be brought up to any required degree of sharpness merely by decreasing the size of the lens stop or aperture. In this connection, it should be remembered that the method of measuring distances with a flexible rule is frequently practicable; and the need for absolute accuracy in taking measurements increases with the focal length of the lens itself.

Another possible cause of trouble is a failure to adjust the front component of the multiple view-finder when changing over from one lens to another. Where the telephoto lens is being used the effect of this oversight would be to secure on the film frame only a portion of the set as viewed through the finder. And the reverse would apply were the oversight concerned with changing back to the normal lens.

Some cameras are not provided with "universal" finders, but are adapted to take matched finders for each of the lenses sold as interchangeable with the original lens. With such cameras, the respective finders must be substituted at the same time as the lenses are changed (one maker recognises the importance of this procedure by having the matched finder-glass permanently attached to the lens mount).

Perhaps the most convenient of all finders is that in which the front com-

ponent is inscribed with sharp lines indicating actual limits of vision for each of the popular lenses normally employed.

### Exposure.

Another matter which has given rise to a good deal of trouble in connection with the use of telephoto lenses is that concerned with the calculation of exposures. Naturally, it will be recognised that any telephoto lens working at, say,  $f/3.5$  must pass the same effective light as any short-focus lens working at the same aperture. But the additional question arises as to what constitutes a long-shot and what constitutes a close-up, for it is well known that the same exposure cannot be applied to both types of shot under a given set of conditions.

Here the importance of distance is but secondary. The governing factor is the size of the image itself. Hence any shot which appears on the screen as a close-up (irrespective of the focal length of the taking lens) must be regarded as a close-up, and must receive the full exposure usually accorded to a close-up.

In the case of negative-positive practice, it is safe to err on the side of generosity. But where reversal film is being used, it is rather more important to avoid any error below or above—and especially above—the meter reading.

For telephoto work cannot be appreciated at its best unless these routine operations of the more familiar kind have been properly carried out.

## A Simple Fake By PETER LE NEVE FOSTER.

**T**HE scenario called for a Neolithic child admiring her reflection in a rock pool. The child was easily fixed by borrowing *her* from one neighbour and a fox fur from another, but the rock pool was a much more difficult proposition. Small suburban gardens do not usually run to rock pools—certainly not to ones which could possibly be mistaken for anything other than man-made receptacles for goldfish.

The country was ten miles away and the chances of finding a suitable pool remote—quite apart from the fact that

one cannot get director, camera-man, "props," camera, artists, and odds and ends, *all* into one Morris Minor.

Necessity is the mother of invention, and in this case produced a sheet of plate glass, a black velvet focussing cloth, a fern, a few stones off the rockery, and some grass from the lawn-mower. The velvet was spread out on the lawn and stretched out to remove any creases. The plate glass was placed over this and was found to give just that rather indefinite sort of reflection that one gets in a pool. The rocks, grass and ferns

were arranged round this to mask off the edges of the glass and to make the thing look as natural as possible.

Our rock pool took under an hour to make and cost us nothing in either material or transport. It also had the advantage of enabling us to film at a time which was convenient, and when the sun was in a suitable position.

A good many people, many of them experienced photographers, have seen the resulting film, but no one has yet succeeded in spotting that this shot is a studio fake from beginning to end.

## SNAPSHOTS IN COLOUR

By  
J. H. CLARK.

IT is not generally known that the ordinary amateur may now take pictures in colour, for transparencies or slides—at least, I have not seen any advertisements to the effect that Agfa roll films are obtainable for colour work.

The great advantage is that no special camera, lens or filter are necessary, although filters of different shades are recommended for exceptional circumstances. Not having come up against anything special I have not used them, but have done just as explained in the maker's instruction booklet, i.e., exposed without any filter, giving an exposure of four times that required for a 700 H. & D. plate.

I make up my own solutions, exactly as directed. For one who does not take this extra trouble the necessary chemicals can be obtained all ready to dissolve in water. Developing may be carried out by the time and temperature method, or by desensitising, and then following the instructions to correct under- or over-exposure.

I have found this such a simple process that I feel sure that, before long, lantern lectures will all be in colour, even for night work. Now, after briefly giving Agfa a good advertisement, I am sure they will not object to my giving the public what I might call "something for nothing."

The roll film gives four exposures at a cost of four shillings, but I have been obtaining six of the same size on each roll,

i.e.,  $3\frac{1}{2} \times 2\frac{1}{4}$ , which is one half more. I expect many who have been using these colour films have noticed the waste at each end and between each picture, and perhaps they have done what I have, or have perhaps been afraid of spoiling some by trial. I have found that by turning the winder of my roll-film holder after loading to the second row of dots past the pointing hand one need not look at the window again. After winding as above the film is ready for the first exposure, then turn the winder exactly three and a half times for the second exposure, then only three times for the third, fourth, fifth and sixth exposures.

There will be plenty of film at each end to accommodate a clip for developing, which I strongly advise using for the developing, reversing and redeveloping. It will be found that no pictures are overlapping, and, in fact, some will have a division between. Even if one or two overlap slightly it will not matter, for it will in any case be necessary to trim off a little of the  $3\frac{1}{4}$ -in. length, as I find the film a little longer than the  $3\frac{1}{4}$ -in. cover-glasses.

So far these remarks have been for those who do not develop each film singly—for those who wish to process each picture separately a little careful measurement will enable them to cut off and develop—if the first one is cut correctly then the following five must be.

## THE WEEK'S MEETINGS

## Wednesday, July 10th.

Northants N.H.P.S. Peterborough.  
Rochdale P.S. Debate: How to arrive at the Exposure.

## Thursday, July 11th.

Hammersmith H.H.P.S. "Photographic Holidays." Mrs. J. Ainger Hall.  
Medway A.P.A. Criticism Reading.  
Northants N.H.P.S. Peterborough.  
North Middlesex P.S. Ciné Film Display. C. J. N. Redfearn.  
Nottingham and Notts P.S. Lincoln.

## Friday, July 12th.

King's Heath and D.P.S. "An Hour with a Naturalist." H. Thompson.

## Saturday, July 13th.

Bradford P.S. Sunnydale, Morton. Meet at Tram Terminus, Crossflat, 2.30 p.m.  
Cripplegate P.S. Outing.  
Exeter C.C. Blackhill.  
Hull P.S. Brocklesby Park.  
Harrogate P.S. Slaithwaite.  
Luton and D.C.C. P.L.A. River and Docks Cruise.  
Northants N.H.P.S. Crick (on Watling Street).  
North Middlesex P.S. Richmond.  
Sheffield P.S. Worsbro'. Meet Exchange St., 1.40 p.m.  
Southampton C.C. Netley Abbey.  
Southend-on-Sea and D.P.S. Great Wakering.

## Saturday, July 13th (contd.).

Stafford P.S. Newport and District.  
Stockport P.S. Disley—Marple.  
Worthing C.C. Bramber.

## Sunday, July 14th.

Blackburn and D.C.C. Alston Hall.  
Ilford P.S. Croxley Green. Meet at Ilford Station, 10 a.m.  
Medway A.P.A. Maidstone.  
South London P.S. Leatherhead and Mickleham.  
South Suburban and C.P.S. Combined Outing with Medway A.P.A. to Maidstone.

## Monday, July 15th.

Oldham P.S. Micro-photography. Mr. Hopson.  
Southampton C.C. Instructional Outing to the Docks.  
Walthamstow and D.P.S. Queries.

## Tuesday, July 16th.

Nelson C.C.

## Wednesday, July 17th.

Luton and D.C.C. P.L.A. River and Docks Cruise.  
Rochdale P.S. Visit to Watergrove. Meet Broadway for 7.45 p.m. bus.  
Southend-on-Sea and D.P.S. Great Wakering.  
Stockport P.S. Portfolio by F. G. Curson.

## A Competition specially for Novices

## SUBJECTS.

Prizes will be awarded for the best snapshots of family groups or single figures taken at home or on holiday, indoors or outdoors. The arrangement of the groups or the pose of the figures is left entirely to the discretion of the competitor.

The competition is open only to novices: those who have never won an award of any description in a photographic competition.

Entries are restricted to contact prints. The smallness of the prints, which may be mounted if necessary, will not affect their careful consideration in this competition.

## PRIZES.

The prizes will consist of supplies of roll film or of plates (if any winner happens to use a plate camera).

THE FIRST PRIZE WILL BE TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.

THE SECOND PRIZE WILL BE TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.

THE THIRD PRIZE WILL BE ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.

TWELVE PRIZES OF ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

The winners of these prizes will thus be encouraged to continue their photographic activities throughout the year with a supply of free film.

## RULES.

Each print must have affixed firmly to the back, a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor.

The latest date for receiving entries is September 7th, 1935. This will give new readers, who are novices, who intend entering this competition every opportunity of improving their work during the next three months by reading "The Amateur Photographer" every week and obtaining their competition prints during the summer holidays.

The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed as follows: The Editor, "The Amateur Photographer," Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices' Competition."

Further references to the competition will be made week by week, and hints given for the best treatment of groups and figures.

# Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Porset House, Stamford Street, London, S.E.1." and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

## Glass-air Surfaces.

After reading in your paper about loss of light in lenses I conclude that is why I get prints like the one enclosed. What is meant by glass-air surfaces? There is only one lens in my camera, and the whole of its surface is exposed to air. How does this affect it? G. M. W. (Deri.)

It is pretty evident that the lens you have does not cover the negative for which it is being used. If you have a lens which is apparently made of a single piece of glass it obviously has two air surfaces—the front and the back. If you add to this lens another similar lens you will therefore have four glass-air surfaces. As some lenses have as many as four different glasses separated from each other there are then eight glass-air surfaces. It is not the loss of light due to this that is the trouble in your own case, but simply that the circle of illumination of the lens is not large enough for the negative on which it is being used.

## Hypo Solution.

How can I make a stock solution of acid-hypo in a Winchester quart bottle? I want to use it for negatives and prints as well. N. D. (Keighley.)

Dissolve 1 lb. of hypo in 2 pints of hot water and pour into the bottle. Now dissolve 1 oz. potassium metabisulphite in a pint of cold water and add this to the other solution. This will be right for negatives and gaslight paper, but for bromide paper you might take two parts of the stock solution and one part of water. Always shake the solution up before use.

## Coating Screen.

Where can I obtain the silver paint used for coating ciné screens? W. J. S. (Bournemouth.)

The material generally used for coating ciné screens is aluminium paint, which you can obtain through any local stores dealing in paints, varnishes, etc. It is a very familiar commercial article.

## Fuzzy Enlargements.

I have made an enlarger, using a lens from an old camera. The projected image looks clear and in focus, but the print is blurred like the one enclosed. Can you suggest any cause for this? G. L. V. (Bolsover.)

If the projected image is sharp and the print is as fuzzy as the one you send the only way we can account for it is that the lens from the old camera is not properly "corrected." If that is so you are focussing with one set of rays while the actual image is formed by another set, and the two do not come to sharp focus on the same plane.

## Fixing Time.

How long must a negative be fixed? S. C. R. (Forest Hill.)

There is a very simple guide as to the proper fixing of negatives. You should first see how long it takes for the milky appearance of the emulsion to disappear, and then give quite as long again in the fixing-bath. If this second period is given in a fresh bath all the better. You will find that the time varies considerably with different plates and films, and is affected by several other factors as well. It follows that no single definite time can be stated.

## Night Photograph.

I want to take a night scene in a well-illuminated railway station, with strong light from a window falling on three figures. I find that the exposure required is 90 seconds. Can I superimpose the group of figures from another negative?

W. H. M. (Ealing.)

We do not think you will have the slightest chance of real success in trying to introduce the figures in the way you describe; they would be sure to be out of keeping with the surroundings in which you placed them. If the spot is, as you say, well illuminated, there seems no reason why anything like 90 seconds should be required with a large stop and a rapid film.

## Copyright.

I had some photographs taken by a local firm, and paid for them. Shall I infringe copyright if I copy them and make postcards from the negatives? V. A. S. (Ewell.)

If we are to understand that you paid the local photographers to take the photographs specially for you, the copyright in the prints is your own, although the actual negatives remain the property of the photographers.

## Altering Focal Length.

If I use a supplementary lens that reduces the focal length of the original lens to about half will the value of the stops be affected? I have been told that  $f/4.5$  will become  $f/8$ . W. S. (Swansea.)

If you shorten the focus of a lens the stops will at once have a different value from those marked, and the  $f$ /number will be smaller in proportion to the shortening of the focus. For example, if you halve the focal length,  $f/8$  becomes  $f/4$ . As yours is a plate camera you can use the focussing screen, and so find the exact position at which the subject is in proper focus. You can then see how much shorter this is than the usual distance, and calculate the stops accordingly.

## Prints for Reproduction.

Would  $3\frac{1}{2} \times 2\frac{1}{4}$  prints be too small to send to an editor of a newspaper? If not, what is the right size? C. P. M. (Liverpool.)

There is no rule as to size of prints submitted for publication, but unless the subject were something extremely unusual the editor of a newspaper would hardly bother about a  $3\frac{1}{2} \times 2\frac{1}{4}$  print. It would mean that he would have to send for the negative and have an enlargement made. We should say that half-plate is about the smallest size acceptable. Press agencies usually submit prints  $10 \times 8$ ,  $12 \times 10$ , or even larger in size, and you must remember that you are having to compete with these.

## P.O.P.

Can you tell me of a printing-out paper that will give black-and-white prints like gaslight? B. L. (Mayfield.)

We regret that we know of no such paper as that you suggest. The nearest is platinotype, which is very expensive, and, of course, requires development, as the printing out is only partial.

## Scratched Films.

I have some negatives, like the one enclosed, badly scratched by a projection in the camera. Is there any means of removing the scratches? R. E. (Wimborne.)

We do not know of any remedy for the scratches on your film, and when they occur the only thing is carefully to retouch the prints. It is very difficult, however, to do this successfully.

## Spoilt Negatives.

The enclosed negatives are on pan. film, but are partly positive. The date on the carton for developing was August, 1935. Do you think the film was old stock? J. J. (Portadown.)

There is nothing wrong with the films as regards staleness or anything of the sort. All the trouble is entirely due to unskilful processing.

# Speaks for itself !!!

BRITISH  
MADE

There is no need to speak at length of the exceptional qualities of the SOHO PRECISION Camera. Read this extract from a letter recently addressed to the London Camera Exchange Co., Ltd., by an advanced amateur photographer:

"You may remember you recently supplied a Soho 'Precision' Camera to me, this is worth its weight in platinum, and is producing as good results as I formerly obtained with a half-plate triple extension camera."

We could ask for no better confirmation of our claim that the SOHO PRECISION possesses all the advantages of a FIELD CAMERA and is in addition as MOBILE AS A POCKET CAMERA.

## THE SOHO PRECISION

**PRICE:** The price of the Camera for  $3\frac{1}{2} \times 2\frac{1}{2}$  size picture, including 3 first-quality double plate-holders, but without lens, is £13:10:0. Leaflet with full specification and particulars of a wide range of lenses free on request.

On and after  
JULY 15th, 1935

# THE London Salon of Photography 1935.

**SENDING-IN DAY, Wednesday, September 4th.**

THE TWENTY-SIXTH EXHIBITION promoted by the Members of the London Salon of Photography will be held at The Galleries of the Royal Society of Painters in Water Colours, 5a, Pall Mall East, London, S.W.1, from SATURDAY, 14th September, to 12th October, 1935.

## CONDITIONS OF ENTRY (Please read carefully).

No. 1. Pictures from exhibitors in the British Isles must not be framed; but may be mounted. Each picture must bear on the back, clearly written—(a) name of artist; (b) number and title of picture; corresponding to particulars on the Entry Form.

No. 2. When mounts are employed, they should conform to the following sizes— $25 \times 20$ ,  $20 \times 16$ , or  $15 \times 12$ , but no mount to exceed  $25 \times 20$ ; and it is suggested that white or light-toned mounts be employed wherever possible.

No. 3. Pictures from abroad must not be mounted (or framed), but should bear full particulars as above.

No. 4. Pictures which are sent unmounted will be suitably mounted by the Salon Committee, and all accepted pictures will be shown under glass.

No. 5. All pictures should be sent by parcels post, packed flat, and properly protected with stiff cardboard and adequate wrappings, addressed to: THE HON. SECRETARY, THE LONDON SALON OF PHOTOGRAPHY, 5A, PALL MALL EAST, LONDON, S.W.1.

No. 6. The sending-in day is Wednesday, September 4th, 1935. All pictures for the Exhibition must arrive at the above address on or before this date. Exhibits may be delivered by hand at the Gallery on this date only.

No. 7. The Entry Form, properly filled in, must be sent with the pictures, together with entry and packing fee of 5/- (this fee covers any number of pictures from one exhibitor).

No. 8. To avoid Customs complications, all entries from without the United Kingdom must be sent by post and without prices marked on the prints. Packages containing such entries should be clearly labelled: "PHOTOGRAPHS FOR EXHIBITION ONLY. NO COMMERCIAL VALUE. TO BE RETURNED TO SENDER."

No. 9. All pictures sent by post will be repacked and returned carriage paid, after the close of the Exhibition.

No. 10. In view of application being made from time to time to The London Salon of Photography for permission to reproduce pictures from the walls of the Gallery, exhibitors are asked to signify on the Entry Form whether they have objection to such permission being given. The copyright, in all cases, remains the property of the authors of the prints.

No. 11. The Committee assure intending exhibitors that the utmost possible care will be taken of all work submitted, but they do not accept any responsibility for loss or damage, either during transit or at the Gallery.

The submission of pictures will be understood to imply acceptance of the above conditions.

Due notification of acceptance of pictures will be sent out as soon as possible.

All correspondence must be addressed to the Hon. Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.

**C. Readers of *The Amateur Photographer & Cinematographer* who are preparing work for this year's Salon may use this page as an ENTRY FORM.**

**SEE CONDITIONS.**

**C. Intending Exhibitors who are unable to secure extra Entry Forms in time may prepare their own on plain paper provided the conditions of Entry are adhered to.**

## FORM OF ENTRY.

TO THE HON. SECRETARY, THE LONDON SALON OF PHOTOGRAPHY.

Sir,—I beg to submit the undermentioned Photographs for the consideration of the Selection Committee, and I enclose Postal Order of the value of 5/- to cover Entrance Fee and the cost of return postage (see conditions 7, 8, and 9).

Reg. No. (leave blank).	A, B or C (leave blank)	Number on Picture.	Title of Picture.

## Business Notices

### Publishing

**OFFICES.**—Dorset House, Stamford Street, London, S.E.1. Telegrams: "Amaphot, Sedist, London." Telephone: Hop 3333 (50 lines).  
**PUBLISHING DATE.**—"The Amateur Photographer and Cinematographer" is on sale throughout the United Kingdom every Wednesday morning.  
**SUBSCRIPTION RATES.**—British Isles 17/4 per annum, Canada 17/4, other countries abroad 19/6 per annum, post free.  
**REMITTANCES.**—Cheques, etc., should be crossed and made payable to Iliffe and Sons Ltd. "The Amateur Photographer" can be obtained abroad from the following: **UNITED STATES:** The International News Co., New York. **FRANCE:** W. H. Smith & Son, 249, Rue Rivoli, Paris; Hachette et Cie, Rue Reaumur, Paris. **BELGIUM:** W. H. Smith & Son, 71-75, Boulevard Adolphe Max, Brussels. **AUSTRALIA:** Gordon & Gotch, Ltd., Melbourne (Victoria), Sydney (N.S.W.), Brisbane (Queensland), Adelaide (S.A.), Perth (W.A.), and Launceston (Tasmania). **NEW ZEALAND:** Gordon & Gotch, Ltd., Wellington, Auckland, Christchurch and Dunedin. **INDIA:** A. H. Wheeler & Co., Bombay, Allahabad and Calcutta. **CANADA:** Imperial News Co., Toronto, Winnipeg and Vancouver; Benjamin News Co., Montreal; Gordon & Gotch, Ltd., Toronto. **SOUTH AFRICA:** Central News Agency, Ltd.

### Displayed Advertisements

Communications on Advertisement matters should be addressed: The Advertisement Manager, "The Amateur Photographer and Cinematographer," Dorset House, Stamford Street, London, S.E.1. Copy for displayed advertisements for the issue of any particular week must reach Dorset House by the first post on Tuesday morning in the week previous. Rates and conditions will be sent upon application.

### Prepaid Advertisements

#### SALE AND EXCHANGE: AMATEURS ONLY—

12 words or less.....1/-  
 1d. for every additional word.  
**PROFESSIONAL AND TRADE:—**  
 12 words or less.....2/6  
 2d. for every additional word.

Each paragraph is charged separately.

**SERIES DISCOUNTS** are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%. All advertisements inserted in these columns must be strictly prepaid and posted to arrive at the Head Office, Dorset House, Stamford Street, S.E.1, not later than first post FRIDAY for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 26a, Renfield Street, Glasgow, C.2.

Advertisements are inserted, as far as possible, in the order received, and those received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders sent in payment for Advertisements should be made payable to **ILIFFE AND SONS LTD.**, and crossed

& Co.

Notes being untraceable if lost in transit, should not be sent as remittances.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

**BOX NUMBERS.**—For the convenience of advertisers, letters may be addressed to numbers at the office of this paper. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charges, which must include the words: "Box 000, c/o 'The Amateur Photographer'." Replies should be addressed: "Box 000, c/o 'The Amateur Photographer,' Dorset House, Stamford Street, London, S.E.1," and these letters will be simply forwarded by us to the advertiser. It must be understood that we do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisement. Readers who reply to Box No. advertisements are warned against sending remittances through the post except in registered envelopes. In all such cases the use of the "Deposit System" is recommended.

### Special Note

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

### Deposit System

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Amateur Photographer and Cinematographer," both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10 a deposit fee of 1/- is charged; on transactions over £10 and under £50 the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, one-half per cent. All deposit matters are dealt with at Dorset House, Stamford Street, London S.E.1, and cheques and money orders should be made payable to Iliffe and Sons Ltd.

## WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

## CAMERAS AND LENSES

# SERVICE SUPREME!

Why do customers write:

"I am more than gratified at the interest you have shown in me," or "Thank you for the attention to detail," etc.?

It is because amateur photography is not only my business but my HOBBY, and this fact, coupled with professional experience, enables me to serve them well. Why not then write me, and as I serve you so give me your business.

ALL MAKES APPARATUS SUPPLIED. EXCHANGES. MONEY BACK IF NOT SATISFIED.

Phone: WALTON 1129, or CALL or WRITE.

# Granville

## Products Produce BETTER PICTURES

All Granville Papers and Cards are subject to a strict process of testing before being offered for sale; every sheet being thoroughly examined before leaving our works. Granville Papers contain a high content of silver, and produce vivid sparkling prints. Speed, Latitude and Gradation are further characteristics which have made Granville Products so universally popular. Note the prices.

Supplied in 20 grades. Single or doubleweight.

## —The Five Feature Film

Every good film has some of the following features to recommend it, but in this, the finest all-purpose film on the market, they are all combined.

**SUPER-FINE GRAIN** for flawless, grain-free enlargements from miniature negatives.

**HIGH SPEED** for short exposures in poor lighting conditions.

**PANCHROMATIC EMULSION** for correct rendering of all colours in monochrome.

**DOUBLE COATING** for long-scale gradation and latitude of exposure.

**ANTI-HALATION BACKING** for rendering highlights without "fuzz."

That is why you should always choose

Morocco zip-fastener case, 5s. extra.

## KODAK RETINA

Taking 35-mm. Film.

With Schneider Xenar  $f/3.5$  lens, in Compur shutter, daylight-loading with Kodak 35-mm. film cassette—takes 36 exposures for **£10:10:0**  
3s. 6d. ....  
Nine monthly payments of 24/6.

It looks  
and acts like a  
camera costing  
double its price!

**Voigtlander  
BRILLIANT**

**45/-**

The Voigtlander "Brilliant" Roll-film Reflex-finder camera shows you the picture crystal-clear and almost FULL SIZE in its hooded finder, just like an expensive reflex does. And it gives you 12 pictures  $2\frac{1}{2}$  in. square on a standard 8-exposure  $2\frac{1}{2} \times 3\frac{1}{4}$  film—twelve for the price of eight! Fitted with a genuine Voigtlander Anastigmat lens, speeded shutter, and three-point focussing, it is a distinct advance over every camera at its price. Ask your dealer to show you the "Brilliant," or write for the "Brilliant" folder. You'll agree that it would still be good value if it cost twice as much!

With  $f/7.7$  Voigtlander VOIGTAR Anastigmat lens.

With  $f/6.3$  Voigtlander Anastigmat lens £3 15 0.  
With  $f/4.5$  Voigtlander Anastigmat lens in Compur shutter, £5 15 0 and in Compur Rapid shutter, £6 15 0.

Scherer Ltd. (Voigtlander Dept. 1), 188/192, High Holborn, W.C.1.

# Six-fold EFFICIENCY!

Never in the history of photography has there been a film pack so efficient in operation as the SELOCHROME FILM PACK.

*Here are its six big features:—*

1  
2  
3  
4  
5  
6

Selochrome Film Pack is absolutely light-tight. There is no possibility of "fogging"—not even at the edges.

Films are kept absolutely flat, and remain so when removed.

The tabs of the pack are of varying lengths. It is almost impossible to pull the wrong tab.

Each film is brought into position with an ease and accuracy never before attained.

One or more films may be removed without opening the pack or removing it from the adapter.

Selochrome Film Pack fits into correct register with any film pack adapter, including those with rounded corners.

## SELOchrome Film Pack

Obtainable from photographic dealers in the following sizes:— $2\frac{3}{4} \times 1\frac{1}{2}$ ,  $3\frac{1}{4} \times 2\frac{1}{4}$ ,  $4\frac{1}{4} \times 3\frac{1}{4}$ , and  $9 \times 12$  cm. Selo Hypersensitive Panchromatic Film Packs are also available.

WEDNESDAY, JULY 17TH, 1935.

Copyright—Registered as a Newspaper  
for transmission in the U.K.

VOL. LXXX. No. 2436.

THE open-air season is now in full swing for the amateur photographer, and holidays, or preparations for holidays, are matters occupying the attention of camera users in all parts of the country. Our readers will therefore welcome our Summer and Open-Air Number that will be published next week. In its pages will be found articles and illustrations making a special appeal to the amateur photographer at this time of year, and dealing with his activities in the country, in town, or by the sea. The pictorial aspect of the holidays will be illustrated, and the beginner will be told how to make the most of his holiday "snaps." An attractive all-over cover in colours will render the issue an outstanding one on the bookstalls, and our readers should look for it on Wednesday next. They will be wise, however, to order in advance to make sure of securing a copy.

### East Anglia.

We have recently been spending a few days in a part of the country so quiet, so different, so detached from the rest that sometimes it was difficult to remember that it was a part of England, namely: the interesting little villages on the north coast of Norfolk, from the mud cliffs of Cromer to the red and white chalk of Hunstanton, villages like Cley, and Stiffkey, Holkham, the Burnhams and Wells, which is rather more than a little village. Here is a fringe of salt marshes, where the heron may be seen by the passengers in a motor-bus. The birds are wonderful. In a twenty miles' drive their song is hardly ever unheard. Then one turns southwards and finds lovely little Sandringham, embosomed just now in rhododendrons.

## TOPICS of the Week

### A WEATHER FORECAST FOR THE WEEK

By D. K. BARTLETT.

#### THURSDAY, JULY 18th.

Continuing mainly fine in England and Wales till the evening, when it will become less bright and more disturbed. Setting in for dull, and perhaps showery, weather in Scotland and Ireland.

#### FRIDAY, JULY 19th.

The North of England into Scotland and Ireland will be showery with thundery weather, clearing later. The Southern half of England will mostly escape this.

#### SATURDAY, JULY 20th.

Warm and fairly bright atmospheres, in spite of a good deal of thundery weather, about the British Isles during this weekend. It would be advisable, even though very warm, to take mackintoshes in case of storms.

#### SUNDAY, JULY 21st.

Inclined to be variable and changeable, since cool air coming in from the West may cause thunderstorms, particularly in Ireland and Scotland, towards the end of the day. There will be some early haze or mist in places.

#### MONDAY, JULY 22nd.

Bright atmosphere, warm temperatures, and some thunderstorms probable. The Southern and Eastern Counties will have the best conditions; Scotland will now have improved conditions where thundery weather has been previously.

#### TUESDAY, JULY 23rd.

Much mist or haze is likely in the South-Western Counties and farther North in the West across to the Northern Midlands. Also some showers, but not excessive. It will remain warm, especially in the South-East of England.

#### WEDNESDAY, JULY 24th.

Mainly fine generally and bright in all parts, with warm temperatures which will cause some mist or haze during the day.

One is a little tired of show places, but Sandringham is an exception, the exterior of the house charming in every aspect, the gardens infinitely refreshing, and the church (from which, by the way, the hatless female hiker is not barred) a little gem. But what an England it is! Just outside the stately gates a sort of fair, ice-cream stalls in the road, geegaws of all sorts, and all the apparatus of a jolly old Bank Holiday. If you want pictures, says north Norfolk, we have them!

### Portraits in Natural Colours.

The mastery of colour rendering in photography proceeds apace, although the poverty of processes for print production remains much the same. Three-colour work is still the best for the purpose, and it is interesting to note that here, personality, as in every other graphic art, dominates the medium. This was well demonstrated in Madame Yevonde's exhibition of colour photography, "Goddesses and Others," at her Salon, 28, Berkeley Square, W.1. Delicate natural colour tones predominated in the portraits exhibited, and all were attractive examples of what the three-colour process can do when intelligently directed. So far as the "goddesses" were concerned, Madame Yevonde told us that Niobe's tears and look of grief were real. She said: "Lady Malcolm Campbell, my sitter, was in agony. Glycerine tears which had been applied for the purpose made her eyes water; then the mascara came off her lashes and her eyes smarted. Presently, real tears poured down her cheeks—Niobe could not have looked more miserable." The curious aqueous quality in the portrait of Arethusa, goddess of fountains and ponds, was produced by hanging

green cellophane in front of the sitter, Lady Bridget Poulett. Medusa's dangerous-looking snakes began life as mechanical pavement toys; except for her "choker," which was a real snake, stuffed—but dead. The goddess of wisdom and war, Minerva, was startlingly 1935, with shell-hat instead of helmet, and revolver instead of spear. The colour values of the metal were definite and good. The exhibition was opened, appropriately, by Mr. John Pennoyre, Secretary-Librarian of the Hellenic Society.

### Films for Posterity.

One of the happiest features of the new National Film Library and Museum, which has been formed under the auspices of the British Film Institute, is the intention to include amateur films in the collection. It would be strange, indeed, if the amateur film were omitted, because, although nothing like the same technical resources are available to the amateur as to the professional, amateur work has always the greater historic significance

because of the uncommercial enthusiasm and love of the art which it betokens. What the amateur has done for photography may very well be found to be paralleled when, at some time in the future, the history of films comes to be written. Another gratifying feature is that news reels are to be preserved. These will be of supreme importance to the historian some day. The news reel in fact is growing in popularity, witness the increase in the number of picture houses devoted principally to this type of production. The doubt which will assail many minds is as to the keeping properties of films for historical purposes. Sealed containers are to be used, and if necessary the films will be reprinted at intervals and stored again.

### Legs.

The great days for legs are here again. It is rare to find a popular newspaper which has not a liberal display of leg on its picture page; if it is not bathing it is acrobatics. They are now suggesting a cream for

legs which makes them look lovely for beach lounging. While they are about it, they might consider the actinic properties of any such composition in order to get new effects in the photograph, which is always in the offing. To some of us the human figure improves with dressing, but that is a matter of taste. The limit, however, seems to be reached in an advertisement which lies before us at the moment. It occupies a whole page of the "Scientific Monthly" of New York, and it praises the merits of Beach House, Siasconset, which we gather is on the Atlantic coast. "Every facility for rest and recreation," runs the advertisement. "Golf, riding, dancing, tennis, and the safest bathing in the Atlantic. Dressing permitted in your room." This is enough to make the camps of the nudists hoist their flag. "Dressing permitted in your room." Is it the idea that only in the privacy of your room can the old-fashioned prejudice in favour of being dressed still be indulged, and that you must go undressed everywhere else?

## READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with on this page week by week. Other replies appear as usual on the last page.

### Chromium Intensification.

You recently gave, in a beginners' lesson, the method of intensifying by bleaching and redeveloping, but I understand the result can be modified by varying the bleacher. Can you give me an idea how to proceed in this manner? T. I. (Colchester.)

The routine is the same whatever degree of intensification is required. The bleaching solution is applied until the colour of the image is changed right through to the back of the negative, which is then washed until all the removable stain has gone. Then a suitable developer is applied, until the colour of the image is restored to black throughout, and slight continuation of the treatment is desirable to make sure that the change is complete.

It is the composition of the bleaching solution that controls the degree of intensification; and it is a good plan to deal with small batches of negatives each of which requires about the same amount of strengthening.

Make up two stock solutions:

- |                         |    |    |    |        |
|-------------------------|----|----|----|--------|
| A. Potassium bichromate | .. | .. | .. | 1 oz.  |
| Water to                | .. | .. | .. | 20 oz. |
| B. Hydrochloric acid    | .. | .. | .. | 1 oz.  |
| Water to                | .. | .. | .. | 10 oz. |

The preparation of A is speeded up if the bichromate crystals are first crushed to powder, and hot water used for dissolving it. The acid in B should be that sold by the chemist as "commercial pure."

The working solutions are:

- For maximum intensification—A, 4 oz., B, 3 drs., water, 16 oz.  
 For medium intensification—A, 8 oz., B, 2 oz., water, 10 oz.  
 For minimum intensification—A, 8 oz., B, 8 oz., water, 4 oz.

As a redeveloper we prefer amidol as used for ordinary negative development.

### Developing Process Plates.

Although I use Process plates I cannot get sufficient contrast in the negative when copying drawings with black lines on white card. Can you recommend a developer which will do what I want? E. E. A. (Swindon.)

A good deal certainly depends on using a suitable developer—one that gives great density and contrast. These can be most readily secured on Process plates.

A hydroquinone-caustic-soda developer works well, but does not keep after mixing. A developer which does keep, and is quite as efficient, can be prepared to the following formula:

- |                         |    |    |    |          |
|-------------------------|----|----|----|----------|
| Hydroquinone            | .. | .. | .. | 130 grs. |
| Sodium sulphite (anhy.) | .. | .. | .. | 3 oz.    |
| Formalin                | .. | .. | .. | 3 drs.   |
| Water to                | .. | .. | .. | 20 oz.   |

Development is best carried out by inspection, and should be continued until the clear lines become unmistakably veiled over. If this occurs too soon, before sufficient density has been secured in the background, the exposure was too long. With a reasonably correct exposure, development can be considerably prolonged before the lines veil over. This slight veiling will entirely disappear in an acid fixing bath, and the reduction of density resulting from fixation will still leave the background practically opaque.

If the black lines were at all weak in the original they will veil over too soon, even with correct exposure, and it may then be necessary to intensify the negative. A contrasty paper for printing is a further aid to perfect reproduction of the original.

In some cases it may be advisable to clear the lines thoroughly of any trace of fog by means of a brief application of Howard Farmer reducer.

# A NOTE ON COLOUR FILTERS

The colour filter should be in every photographer's outfit, particularly during the present open-air season. In the following article its use is explained for the benefit of those who have never used one before, and some hints for the beginner are given upon the choice of a filter.

**M**OST amateur photographers in these days are users of colour-sensitive material. All the best modern films are orthochromatic, and they are more highly sensitive than were the older roll films, which were also sensitive to colour to some extent.

There is also a greater tendency to use panchromatic plates and films, which are necessary if the best results are to be secured with many subjects, although they may not be essential in every case.

It is also true to say that although the manufacturer has placed a new power in the photographer's hands, many users do not obtain the best results. There are misconceptions existing with regard to colour-sensitive materials, especially in the mind of the beginner.

## Filters Necessary.

The orthochromatic film is sensitive to green and yellow light rays, and the panchromatic to the red rays as well, but both are still highly sensitive to the blue-violet rays. If these are absorbed, by placing a filter on the lens of the camera, the result will be that the film is able to record the colours of the subject in their correct relative depths or intensities, sometimes termed colour values.

If, therefore, the photographer is using material which is sensitive to colour, and disdains the use of a colour filter, it means that he is not getting the best from his materials. Panchromatic plates or films will, it is true, give a better result without a screen than can be obtained with colour-blind material, but a screen is necessary in order to secure the best results.

## Types of Filters.

The beginner may well be confused by the variety of screens offered. Actually, these differ in capacity according to their depth of colour,

while some are only suited to panchromatic materials.

There are some which do not necessitate any increase in the exposure, their purpose is to cut out haze and to make the distance photograph more clearly. There are others so adjusted that they result in a false rendering. They are used for special purposes, where it is necessary to produce an effect of contrast, as is the case when it is necessary to show the figure of grain in dark wood.

The photographer who is interested in the general run of subjects will find it necessary to have only one filter. It should be of medium depth, in order that exposures may not be unduly prolonged.

It will mean that the exposure with a panchromatic plate or film will be shorter with a filter of this type than is the case with an orthochromatic emulsion, due to the increased sensitiveness of the former.

## The Filter in Use.

The photographer is recommended to use a filter which is made by the same firm as his plates or films. The advantage of this is that the essential conditions of adequate correction with the minimum of increase in exposure will be assured.

The filter by one maker, used with the plate or film by another, may necessitate an increase of exposure greater than would be the case with the filter calculated for the material. Further, the maker of the filter will give a table of exposure factors which apply to his own goods.

These filters may be very satisfactory in the form of thin sheet gelatine, which is placed between a sheet of thin folded paper upon which is marked a circle a fraction smaller than the inside diameter of the lens. The filter cut to the required size is inserted in the lens, care being taken to drop it in, and

to drop it out on to paper, so that it is not touched with the fingers. Filters treated in this way will remain in good working condition for years.

If the photographer is in any doubt as to the effect of a filter, it is a good plan to obtain one in this inexpensive form, and if satisfactory to replace with one cemented and mounted.

## Special Cases.

The fact that filters can be obtained in the inexpensive form referred to above permits their use in cases where a result of far better quality is easily secured. When, for example, it is wished to produce a very clear picture on a dull day the use of a deep filter with panchromatic films will work wonders.

If the photographer wants to copy a strong sepia-toned print on white paper, he should use an orthochromatic plate and pale yellow filter. If, however, the print is on cream paper, a panchromatic plate or film should be used in conjunction with a yellow filter.

In the case of an old faded photograph an "ordinary" plate and pale blue filter will generally give a strong copy.

It is sometimes argued that the use of a lens filter has a bad effect upon the definition given by the lens. This is not the case with a film filter as described above, and if the defect is noticed it is the result of using a filter that is cemented in poor quality glass, which is in effect a low-power lens, introducing another element into the lens system.

It is important in the case of filters mounted between glass that not only should good glass be used, preferably optically plane glass which will have no effect upon the definition, but also the filter should fit close to the lens. These points are very important if the lens is a large-aperture anastigmat.

# "Almost any Camera...."

By S. C. DIBBEN.

IN regard to the many special articles appearing from time to time in *The Amateur Photographer* one often sees the quotation, "Almost any camera may be used." But in spite of this assurance many beginners attempt nothing more ambitious than mere snapshots.

Probably the textbook advice (admittedly quite sound) to keep within the limitations of one's instrument is responsible for this; but keeping within limits is quite a different matter from failing to exploit possibilities to their fullest.

The main factor of success is not so much the instrument employed as "the man behind the gun."

The illustrations reproduced were taken by ordinary window lighting, without the aid of reflectors, etc. For "Our Dad" the sitter directly faced the window, the exposure being made from the side, and from a somewhat high viewpoint. For "Mother" the subject was placed side face to the same window and photographed almost full face from eye-level, the usual viewpoint for portraiture.

The subjects were chosen for special reasons. For instance, they illustrate the difference between an ordinary portrait attempt and what we may term a "portrait picture." In the latter there is some attempt at composition, effective lighting, and a studied viewpoint. It will be noted that the "strong position" so often advocated by "Mentor" has been borne in mind, although this placing does not necessarily apply to all portraiture, but in this instance its observance is a decided advantage.

*Our Dad.*

*Mother.*

Here are two other points worth bearing in mind. Should your sitters be wearing spectacles, be careful to avoid any reflection in the lenses, or the subsequent result may be a pair of "blinkers" with the eyes entirely obliterated. Do not place your subjects too near a window, nor in direct sunlight. Five or six feet is usually a suitable distance; otherwise, more especially with a strong light, the features will lack tone and modelling.

Probably the "picture portrait" will prove the easier, especially when a small-aperture lens is used. In this case, the sitter may be reading, writing, playing the violin, etc., and there is little risk of the camera consciousness that is likely to be apparent in a portrait attempt owing to the comparatively long exposure that may be necessary.

It is useless to attempt to give approximate exposures; conditions of lighting, time of day, lens aperture, all have to be considered. An exposure meter is the best possible guide. I will, however, give some data relating to the illustrations, in order to bear out the statement that almost any camera may be used. The instrument employed was a popular-priced quarter-plate single-extension plate camera, f/6.3 lens, three-speed shutter, backed ortho. plates.

And now at the risk of shocking the more technically inclined I must say I seldom use an exposure meter except for interiors and subjects requiring extreme exposures. I find "The A.P." monthly exposure table, plus a little common sense, will almost invariably meet the case. I usually read the exposure time for f/8 and expose at f/6.3 as no reflectors are employed, and use a slightly-diluted

# Ease, Speed & Accuracy

## IKONTA

The Zeiss Ikon Ikonta is an easy camera to use, because a press on the button automatically opens it to the position ready for taking the picture, and also erects the direct-vision finder. Further, the "two-point setting" of diaphragm and lens focussing makes the taking of snapshots as easy as with box cameras.

The Ikonta is the camera for speed, because it is fitted with rapid optical equipment  $f/4.5$ ,  $f/3.5$  or  $f/3.8$  Zeiss Tessars, and the new Rapid Compur shutter to  $1/5000$ th second in the two smaller sizes, and  $1/4000$ th in the two larger sizes.

The Ikonta is noted for its accuracy. It is a precision-made camera fitted with precision optics, precision shutters, and without the slightest shake or backlash in its construction. Pictures taken with the Ikonta can be enlarged up to almost any size required.

Made in four sizes :

No. 520/18 for 16 pictures  $1\frac{1}{8} \times 1\frac{1}{4}$  in.

No. 520 for 16 pictures  $2\frac{1}{4} \times 1\frac{1}{4}$  in.

No. 520/2 for 8 pictures  $3\frac{1}{4} \times 2\frac{1}{4}$  or  $16 \times 2\frac{1}{4} \times 1\frac{1}{4}$  in.

No. 520/15 for 8 pictures  $4\frac{1}{4} \times 2\frac{1}{4}$  or  $16 \times 2\frac{1}{4} \times 2\frac{1}{4}$  in.

Prices from £3 12s. 6d. to £15 12s. 6d.

The Ikonta takes any standard make of roll films, but preference should be given to the Zeiss Ikon Pernox **ORTHOCHROMATIC AND PANCHROMATIC** on account of its extreme rapidity ( $26^\circ$  Scheiner), its fineness of grain, its ability to render colours correctly in monochrome, and the latitude permitted in exposure and development.

Descriptive folder free. 80-page Illustrated Catalogue for 3d. in stamps. Zeiss Ikon cameras are obtainable from most good camera shops.

**ZEISS IKON LTD.,** 11, MORTIMER HOUSE,  
MORTIMER ST., LONDON, W.1

## YOU CANNOT DO BETTER

### THE VOIGTLANDER BESSA

Takes 8 pictures  $3\frac{1}{2} \times 2\frac{1}{2}$  or 16 pictures  $2\frac{1}{2} \times 1\frac{1}{8}$  on standard  $3\frac{1}{2} \times 2\frac{1}{2}$  roll films, 620 or 120 size.

New design base-board which ensures perfect rigidity. Unique trigger release fitted under the base-board. Supplied in 8 models

#### PRICES.

F/6.3 Voigtlander anastigmat, Pronto 3-speed shutter..... **£3:12:6**  
F/4.5 Voigtlander anastigmat, Pronto delayed-action 3-speed shutter..... **£5:7:6**  
Nine monthly payments of 12/7.  
F/4.5 Voigtlander anastigmat, delayed-action Compur shutter, speeds 1 to 1/250th sec., T. and B..... **£7:5:0**  
Nine monthly payments of 18/11.

### THE NEW SUPER IKONTA

Takes 11 pictures  $2\frac{1}{2} \times 2\frac{1}{2}$  on standard  $3\frac{1}{2} \times 2\frac{1}{2}$  roll film

Special device to avoid double exposures, latest pattern distance meter coupled to lens focusing, f/3.5 Zeiss Tessar anastigmat, Rapid Compur shutter, speeds 1 to 1/400th sec., T..... **£25:5:0**  
and B.....  
Nine monthly payments of 58/11.

F/2.8 Zeiss Tessar anastigmat, Rapid Compur shutter, as above..... **£28:5:0**  
Nine monthly payments of 65/11.

### The Multi-speed EXAKTA

Self-capping focal-plane shutter, speeds 12 to 1/1,000th sec., T. & B., delayed action 1/10th to 6 sec.  
Fitted f/2.8 Zeiss Tessar anastigmat, metal focusing hood, with magnifier, simple focusing, 3 ft. to infinity. Takes standard V.P. films..... **£27:10:0**  
Double exposures an impossibility.....  
Nine monthly payments of 64/2.

### THE FOTH-DERBY FOCAL-PLANE AN IDEAL SPORTS CAMERA

Takes 16 pictures on V.P. film.

F/3.5 Foth anastigmat, self-capping focal-plane shutter, with delayed-action device, speeds 1/25th to 1/500th sec. and B. Very compact..... **£5:5:0**  
Nine monthly payments of 12/3.  
F/2.5 Foth anastigmat..... **£7:5:0**  
Nine monthly payments of 16/11.

### "AGFA SPEEDEX"

MODEL "O."

Takes standard V.P. roll films.

Fitted f/3.9 Solinar anastigmat, in Compur shutter, speeds 1 to 1/300th sec., T. and B., self-erecting front, optical direct-vision finder..... **£5:5:0**

Nine monthly payments of 12/3.  
 $3\frac{1}{2} \times 2\frac{1}{2}$ , f/4.5 Agfa Solinar anastigmat, delayed-action Compur shutter, speeds 1 to 1/250th sec., T. and B..... **£7:7:0**

Nine monthly payments of 17/2.

### THE NEW MODEL IIIa LEICA

Shutter Speeds 1 to 1/1,000th sec.

The Precision Camera.

F/2 Summar, automatic focusing, interchangeable lens mount, all chromium plated..... **£43:0:0**

Nine monthly payments of 100/6.  
Model III, f/2 Summar, self-capping focal-plane shutter, speeds 1 to 1/500th sec., T. and B., chromium plated..... **£40:16:0**  
Nine monthly payments of 85/3.

### THE DEKKO CINÉ CAMERA

for 9.5-mm. films.

British Made.

20-mm. f/3.5 Dallmeyer anastigmat (fixed focus), interchangeable screw-in lens mount. Variable speeds, half to normal and slow motion, 64 pictures per second, single - picture device, spring drive motor, taking through full 30 ft. of film at one winding, telescope type finder, built inside the camera.

body of special wear-resisting bakelite. All outside fittings and film gate..... **£6:6:0**

chromium plated..... of 14/9.

F/2.5 Taylor-Hobson anastigmat, fixed focus..... **£6:16:6**

Nine monthly payments of 16/-.

1-in. f/1.9 Dallmeyer, micrometer focussing..... **£9:18:6**

Nine monthly payments of 23/2.

### THE NEW ROLLEICORD

F/3.8 Zeiss Triotar anastigmat, Compur shutter, speeds 1 to 1/300th sec., T. and B..... **£12:15:0**

Nine monthly payments of 26/9.

The new Rolleicord takes 12 pictures on standard  $3\frac{1}{2} \times 2\frac{1}{2}$  roll films, and is also adapted to take the Rolleiflex Plate back and other Rolleiflex accessories, excluding the cine film attachment and angle mirror.

July 17th, 1935

developer in order to obtain a fairly plucky negative with good gradation suitable for contact printing or enlarging.

Should a film camera be used, be sure that the scale marking is accurate, and take the precaution to measure if you are not good at calculating distances, in order to obtain correct focus. It is wise to experiment with an improvised focussing screen—just a piece of ground glass supported in the same plane in which the film falls is

all that is necessary. The view-finder is not usually reliable with "close-ups," but once tested the necessary allowances may be calculated fairly accurately.

Now just for a last word. Buy a tripod. Occasional tables, books, cigar-boxes, etc., will serve, but they are not worth the trouble. A good old-fashioned ash tripod may seem out of place with the present-day light cameras, but for indoor work it takes a lot of beating.

# Snapshots from the Air

By G. S. BROWN.

NOW that cheap aeroplane trips are so popular, it is probable that amateur photography will be extended to aerial photography. A few notes on the subject may be of use to those intending to take a camera up with them, and may possibly help to avoid a waste of film and opportunity.

Nothing exceptional in the way of apparatus is necessary. The average popular camera is quite capable of giving reasonably good results.

As the observer is well sunk in the cockpit, with only head and shoulders exposed, the usual reflecting view-finder is useless, since it can only be conveniently used when the operator is standing up, and since it is not suited to the observation of a rapidly changing view. A direct-vision finder of the simple window type is a great asset; without it the camera must just be roughly aimed at the desired view.

One of the chief merits of a photograph from the air lies in the unusual viewpoint. In the picture it is desirable to convey an impression of height, and for this reason the best photographs (apart from those of clouds or other aircraft, which one does not usually get on a short trip) are made with the camera pointing more or less downwards.

A photograph taken from a plane horizontally has no more interest than one taken from a hilltop. At the same time, absolutely vertical photographs should be avoided, as they give too much of the flatness of a plan. To get any verticality at all, however, with the plane flying horizontally it would be necessary to rise from one's seat and lean over the fuselage—a procedure not to be advised.

Before going up, therefore, the pilot should be asked to co-operate by taking several sharp turns, banking as much as possible. The plane banking on a turn gives just about the most suitable angle for a photograph, assuming the

camera to be pointed at an angle of about 15 degrees steeper than the wings of the plane.

An exposure of anything over  $1/25$ th of a second is almost sure to be hopelessly blurred. For most amateurs, therefore, it will be necessary to select a clear sunny day, and to go up around noon. The shortest exposure that the lens aperture of the camera will allow is the one to use. The reason for the necessity of a short exposure is not that the subject is moving (in relation to the camera the ground moves pretty slowly, owing to the intervening distance), but that the vibration of the engine shakes the camera.

The camera should be held free from the plane, and should not be held against the eye for aiming, so that all the play of the arm joints and muscles comes in to damp out vibration.

A photograph from the air is greatly improved by the inclusion of some part of the plane itself. This happens to be a very simple matter; the difficulty would be rather to avoid the plane.

The accompanying photographs were taken earlier this year, at about six o'clock in the afternoon. An exposure of  $1/50$ th second with an aperture of  $f/6.3$  was given. This turned out to be more than enough. A slight movement can be detected in the original negatives, although not apparent in the reproduction;  $1/100$ th of a second would have shown practically no movement.

Finally, a series of photographs from the air is fittingly completed by one of the plane itself, which shows to advantage landing or taking off. Here again the direct-vision finder is invaluable, as with it the plane in motion can be easily followed, and the exposure made with the camera in motion. An exposure of  $1/50$ th sec. has the effect of giving a sharp image of the plane, and a blurred background, and producing the impression of speed very effectively.

July 17th, 1935

# SPORTS

By BERNARD ALFIERI, Jun.

As, however, small parts of the negative can be enlarged if they are really sharp, this need not be much of a handicap, and it is always easier to catch the incident from a moderate distance than rely on

*Long Jump at Hampton School Sports. Exposure 1/500th sec. at f/3.5. Low viewpoint. Pan. film, without filter.*

**F**EW subjects offer such a variety of fast-moving incidents for the amateur photographer as a sports meeting, or can give such good practice in the art of "pushing the button" at the right moment.

Most cameras fitted with quick-acting shutters are suitable for the work, but it must be remembered that the nearer to the subject the more rapid the exposure must be to arrest fast action. For this reason the photographer with a shutter that will not exceed 1/100th of a second should not approach as near to a fast-moving subject as the photographer who has a high-speed focal-plane shutter giving 1/1,000th.

*An ideal subject for the miniature camera. 1/500th at f/3.5. Pan. film.*

*Tug-of-war. Police Sports, Imber Court. Exposure 1/25th sec. at f/16. The small aperture was necessary to obtain depth of focus.*

# A Subject for Rapid Exposures

including the subject full size on the negative. A miniature camera is undoubtedly one of the easiest to use for very rapid shots, as, owing to the short focal length of the lens, a great depth of focus is available at a comparatively large aperture, and the speed of the shutter can be set at its fastest. Many of the modern small cameras are also fitted with Compur shutters giving  $1/3000$ th or  $1/5000$ th sec.

Any very rapid plates or films can be used, although it is a great advantage to employ super-speed panchromatic material. In actual practice it will be found that a good tone quality in a blue sky, sufficient to throw white sports clothes into relief against a grey background, will be obtained without the use of a filter. Where it is possible to make an exposure with the sun to one side of the camera, good modelling and a range of tone values can be preserved

Hurdles. Exposure  $1/1,000$ th sec.,  $f/3.5$ .

in the whites, which would be difficult if the so-called colour-blind films were employed.

A low viewpoint is often the means of obtaining a striking picture, particularly as it enables the subject to be taken against the sky, and gives an impression of height. With

High Jump at School Sports, Hampton.  $1/1,000$ th sec.,  $f/4.5$ , on rapid colour-blind plate. Compare lack of tone quality in sky with long jump picture.

many of the sports events the effect of the composition can often be viewed before making the exposure, as in most cases there will be plenty of repetition. For this reason such subjects as high jump, long jump, hurdles, etc., are not as difficult as they may appear.

A reflex or one of the miniature twin-lens cameras is very useful for the purpose, as it is a simple matter to rest it on the ground and focus on the top of a hurdle, a tape, or other centre of interest in the correct focal plane. It is then only necessary to watch a few competitors pass the spot to determine the best possible moment to make the actual exposure later on.

Hurdles. Police Sports at Imber Court. Exposure  $1/500$ th sec. Note figures are coming towards camera. If taken broadside on a shorter exposure would have been necessary.

# Letters to the Editor

*The Editor is not responsible for the opinions of his correspondents.*

## CAMERA MOVEMENT DURING EXPOSURE.

SIR,—In Mr. Dickinson's ingenious theory published under the above heading, he comes to the rather startling conclusion that the longer the focal length of a lens the less one has to worry about movement during exposure. Splendid; now we will be able to use a 6-in. lens on our ciné cameras without bothering about a tripod, in fact the tripod will only be needed with the  $\frac{7}{8}$ -in. lens. Very interesting, but Mr. Dickinson has made the most curious supposition in the diagrams on which he builds his theory—apparently the lens is fixed immovably in space while the movement takes place only in the focal-plane!

It is this small item which has led him astray. Actually, the shorter the focal length of the lens the less the effect of camera-shake. A few moments' consideration will, I think, make this clear.—Yours, etc.,

H. RONALD BUCKMASTER.

## PAPER NEGATIVES.

SIR,—I note that in reply to a reader's question it was stated that negatives made on a paper base cannot be printed in the usual way, but should be copied on bromide paper. I had occasion to make a print from one of those "paper" negatives and obtained a print which I considered quite as good as one made from a "celluloid" negative, by the usual method of contact printing; the exposure necessary is approximately twenty to thirty times that required for a "celluloid" negative. This, of course, was obtained by holding the printing frame nearer to the light and using a more powerful electric bulb with which to make such exposure, thereby saving a certain amount of time in the process.—Yours, etc.,

K. KOORIE.

## FILM ECONOMY.

SIR,—Your correspondent Mr. John Lea and anyone interested may solve the difficulty of winding the film correctly in the following manner. Commencing with a new film, wind until the *first dot* appears in the red window, expose, then wind until No. 1 just disappears, again expose and then wind until the first dot again appears and so on. After many experiments I have found this to be the only reliable method. It applies to Kodak and Ilford films, but may not work with others unless one assures oneself that the dot markings, etc. are the same.—Yours, etc.,

JOHN H. CLUCAS.

SIR,—With regard to Mr. Lea's letter in July 3rd issue, I would like to say that I experienced the same difficulty as he describes. After a little investigation on a dummy spool, I discovered a reliable method of getting the film in the correct position for sixteen pictures on a standard eight-exposure roll. As most people are aware, before each number on the paper backing appears, there are some warning dots. The first of these dots occurs almost exactly halfway between the numbers. Thus, if the film is wound alternately to the dots and the numbers, sixteen pictures may readily be obtained in the correct position. I may say that the first exposure may get spoilt in development if this is carried out by a D. and P. firm.—Yours, etc.,

A. ROBERTS.

SIR,—The following method of taking sixteen exposures on a roll film, when using a roll-film holder (Holborn latest pattern) in a plate camera, may be of interest.

A metal mask cut with a half-size opening located in the centre of the film space is put in the holder in place of the cover plate, after roll-holder is placed in camera.

The winding of the film is as follows: No. 1 to *first dot* before the number; No. 2 to  $\frac{1}{16}$ th in. (which is easily guessed) past the border of the line surrounding the number.

In practice it is quite simple to get the exposures evenly spaced, especially as a check is provided on every other exposure, which comes on the first dot.

It is also possible, following the second and each even number half-size picture, to revert to a full-size picture (wasting about one inch of film) by withdrawing the half-size mask, and turning the spool so that the *fourth dot* (instead of the first dot or a half-size picture) is shown in the viewing window. By this method the succeeding picture, if a full size, is wound to the next fourth dot, or for a half-size to the first dot before the next number.

Care, of course, must be taken to see that the mask is inserted for the half-size pictures, and the holder must not be removed for focussing without the safety cover being in position.—Yours, etc.,

H. ESSEX.

## WHY NOT AN "A.P." CLUB?

SIR—I have read with great interest and enthusiasm the suggestion by your reader, Mr. F. E. Willatt, to form an "A.P." Club, and should like to add my endorsement to those readers whose replies have already appeared.

May I make a further suggestion?

Every reader of the excellent "A.P." should be invited to send in a drawing of his idea of a design for the proposed badge. This should prove the popularity of Mr. Willatt's suggestion.—Yours, etc.,

H. A. MARKWICK.

## EXPOSURE METERS.

SIR,—I think you will find that Mr. Irwin and Mr. Bailey are both wrong in their calculation of the relative exposure given to the Leica films: (A) used Agfa Superpan film, approximately 1,200 H. & D. to daylight (my own rating), and exposed for  $\frac{1}{40}$ th sec. at  $f/6.3$ . (B) used Agfa Isopan film, approximately 650 H. & D. to daylight (again my own rating), and exposed for  $\frac{1}{200}$ th sec. at  $f/4.5$ , using an  $\times 3$  filter.

By exposing through the filter (B) has therefore given three times the exposure necessary without it, i.e.,  $\frac{1}{600}$ th at  $f/4.5$ .

Therefore, assuming that  $\frac{1}{600}$ th at  $f/4.5$  is correct,  $\frac{1}{300}$ th at  $f/6.3$  would also be correct, making a variation of  $7\frac{1}{2}$  times.

But we haven't got to the bottom of it yet. (B) has also used a film approximately only half the speed of (A's), which makes the difference in exposure actually 12 to 15 times.

The real questions involved are surely not connected with the reliability of exposure meters, but the following:

- 1.—Is (B's) shutter speed actually  $\frac{1}{200}$ th? (Doubtful.)
- 2.—Is (B's)  $\times 3$  filter actually  $\times 3$  with Agfa pan. emulsion? (Extremely doubtful.)

3.—Was the processing done by one firm in the same developer, at the same time, for the same duration? If so, (A's) Superpan film only had about 80 per cent of the relative development of (B's).

At first glance, 12 to 15 times the correct exposure would seem to be hopeless. But tests have confirmed the claims of manufacturers that enormous latitude is permissible, but this only applies to *over-exposure*, and not to *under-exposure*, and even then there is always a decided loss in quality of gradation and grain size, which with miniature negative work is definitely bad.—Yours, etc.,

A. FURNESS.

SIR,—In reply to Mr. Bailey's criticism of my calculation, I used exactly the same method adopted by him, and agree with him that  $\frac{1}{100}$ th sec. at  $f/6.3$  is the same as  $\frac{1}{200}$ th sec. at  $f/4.5$ , but the fact that there was an  $\times 3$  filter in addition means that my film only got through the equivalent of  $\frac{1}{300}$ th sec. of light, whereas I should, of course, have multiplied by 3 and given  $\frac{1}{33}$ rd sec. as he rightly points out.

The difference between my friend's  $\frac{1}{40}$ th at  $f/6.3$  and my  $\frac{1}{300}$ th is, as I pointed out in my letter, a difference of nearly eight times.

In spite of this I have bought the exposure meter.—Yours, etc.,

A. C. S. IRWIN.

July 17th, 1935

# GADGETS

## Hints and Tips for the Practical Worker.

### WASHING FILMS IN THE "CORREX" TANK.

HERE is a simple way of washing roll films in the "Correx" tank, without removing them after fixing.

Procure a cork to fit inside the top hole of the film reel, and in this cork bore a hole to make a close fit with a length of rubber tubing.

To start the siphonic action, first fill up the tank with water and then the tubing, the open end of which may be conveniently placed down the drain. A slight overflow of water is advisable.

This siphon will remove the water from the bottom of the tank and thus ensure perfect washing of the film without further handling or attention.

R. M. SMITH.

### A PRINT-GLAZING HINT.

Being one of the many keen photographers who cannot afford to spend much money on their hobby, I was unable to buy the rubber squeegee necessary for glazing prints.

Then it occurred to me to put them on a ferrotype plate through a mangle, which must, of course, have rubber rollers. I first soak the wet prints for a minute in formalin (1 part to 5 of water), rinse them and afterwards transfer them to the ferrotype plate, which has been carefully washed with warm soapy water and polished with methylated spirit. Then simply pass the whole plate through the mangle, first one way and then the other.

Do not force the prints to come off by putting them near a fire or the glaze

will become cracked, but allow them to peel off in about four hours by placing them in a warm room, such as the kitchen.

E. H. ROBINSON.

### AN AUTO-DEVELOPER FOR MINIATURISTS.

Amateur photographers who use a drum developer for their strip negatives may be interested in this gadget. I fixed it to eliminate the only drawback to drum development—the handle-turning, which is a particularly tedious operation if prolonged.

As the photographs show, an old gramophone motor (picked up for 3s. 6d.) is fitted with Meccano gear wheels to drive the glass drum on which the film is clipped. I found that, with a two to one gear, and the governor set to 70, the drum turns at a suitable speed for fifteen minutes.

The steel frame which supports the spindle of the drum slides between two wood slats. If the frame is moved forward the gears engage, and the frame is simply pushed back and lifted off the dish to remove the developer.

The method I have found best is simple. The film is clipped on the drum

with everything in place. The drum is then started and the developer poured in. While the film is developing I cut and load the new strip or else put a cover over the drum and turn up the lights. No light of any sort is needed at any stage. When development is complete I siphon off the developer and pour in water, then run in the hypo and turn on the light.

With the governor set to 90 I find no trace of hypo after twenty minutes' washing.

If any subsequent reduction or intensification is needed the advantage of this method over tanks is even more evident.

G. F. HUGHES.

### A FILTERING HINT.

Filtering, as most of us have found out, is a long and irritating job, but an essential one—for a well-dusted camera and slides and filtered solutions are the only cure for pinholes, etc.

If the solution to be filtered is poured straight into the funnel, one has to watch it all the time to keep the funnel full. It is a well-known fact that if a bottle containing a liquid is inverted so that the mouth is under the surface of some more of the liquid that in the bottle is held in by atmospheric pressure. If, however, the mouth of the bottle is raised above the surface, the liquid in the bottle immediately flows out until the mouth of the bottle is again submerged. The solution to be filtered should therefore be put into a bottle and inverted into the funnel with the mouth of the bottle just below the

edge of the filter paper, as in the illustration. The bottle will then automatically fill the funnel as fast as the filtered solution runs through.

The circular filter paper should be folded in the usual manner.

Any method of holding the various pieces of apparatus will, of course, do just as well as the one illustrated.

R. O. COUCHMAN.

# NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

An Exhibition of Pictures by members of the Leicester and Leicestershire Photographic Society will be held at the Camera Club, 17, John Street, Adelphi, W.C.2, from July 23rd to August 10th, inclusive. Admission is free to all readers of *The Amateur Photographer* upon signing the visitors' book.

The new Vauxhall ciné tripod is an attractive and well-made article. Its length when closed is 21 in. It extends by three draw-tubes to 51 in. Each section is controlled by double push buttons, thus enabling the stand to carry a heavy weight without collapse or vibration. The exterior is ribbed

dead-black metal, the draw-tubes being constructed of aluminium alloy. The feet are particularly ingenious; normally the legs are pointed for use on rough ground, but if the stand is required upon polished floors or linos, the feet are screwed anti-clockwise and rubber suction-cups take the place of the points. It is impossible to unscrew these completely off, so that there is no danger of any part being lost or mislaid. There is a "panning" top, both tilt and swing, operated by a lever handle that is locked by a rapid movement. A spirit-level is incorporated, and the degrees of a complete circle engraved. At £5 15s. it represents very good value for money. This tripod is handled by The Camera Company, 320, Vauxhall Bridge Road, Victoria, London, S.W.1.

The Exhibition of Leica photographs recently on view at the Galleries of the Royal Society of Painters in Water Colours in London, has now been transferred to the Pump Room, Bath, where, under the auspices of Mr. Cyril Howe, the well-known Bath photographic dealer, it will remain until August 7th. The hours are from 10 a.m. to 7 p.m.

**Lost.**—One of our contributors, Mr. S. E. L. Moir, informs us that during the evening of Sunday, June 30th, after working on a film at Paslow Hall Farm, High Ongar, Essex, he lost a Tempophot meter in red deerskin case from his car. This was later seen in the roadside at the Farm Lodge by a cyclist. Will anyone who found this meter kindly communicate with Mr. Moir, c/o "The A.P."

The Council of the Royal Zoological Society of Ireland have announced a competition for amateur photographers. Prizes will be awarded for photographs of the animals taken in the Society's Gardens in the Phoenix Park, Dublin. A copy of the conditions and list of the prizes offered is obtainable on request from Mr. A. Kane, 2, Foster Terrace, Ballybough Road, Dublin.

The Canadian International Salon of Photography will be held in the National Gallery, Ottawa, from November 6th to 21st, and will then be circulated to other galleries in leading Canadian cities. Entry forms for this exhibition are ready and are obtainable from the Secretary of the Salon, at the National Gallery, Ottawa, Canada.

New and practical improvements have been introduced by Messrs. Voigtlander in their latest line of "Bessa" cameras for  $2\frac{1}{2} \times 3\frac{1}{4}$  roll films with either the 620 or 120 spools. The main feature of all these cameras is the new shutter

release, which is transmitted by a lever from the shutter to the camera body. This obviates any tendency to jerk the camera front, which is a common cause of blurred pictures. Film loading is remarkably simple; spring pockets are hinged each end of the camera, which keep the film in good tension, and when the film is being loaded or removed,

ensure it against unravelling. The popular alternative feature of either eight or sixteen exposures is fitted, and the film pressure-plate is lined underneath with velvet, which traps any possible reflected light from fogging panchromatic films. The eye-level view-finder is also adapted for both sizes, either of which can be left in position for immediate use. The finish of these cameras is very good, two noteworthy features being that all the outside edges are raised and polished to take the wear, and a depth-of-focus table is fitted to the back to complete the equipment. The prices of the "Bessa" cameras range from £2 12s. 6d. to £8 8s., according to the lens and shutter equipment. Schering, Ltd., of 188-192, High Holborn, W.C.1, are the British agents for Voigtlander apparatus and materials, and they will supply any reader of "The A.P." with further particulars of this and all other cameras made by the firm free on request.

## Exhibitions and Competitions

### CURRENT AND FUTURE.

Notices of forthcoming exhibitions and competitions will be included here every week if particulars are sent by the responsible organisers.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers. Entries, July 31. Rules in the issue of June 26.

California Pacific International Exhibition, San Diego.—May 29–November 11. Particulars from Miss Ruth Kilbourne, Exhibition Headquarters, Balboa Park, San Diego, Cal., U.S.A.

Western Salon of Photography.—June 29–July 31. Hon. Salon Secretary, S. R. Lewin, 107, Shakespear Avenue, Bath.

Lincoln Camera Club Annual Exhibition.—Open, July 5–28. Hon. Exhibition Secretary, J. H. Hutchinson, 44, Richmond Road, Lincoln.

Paris International Salon.—October 5–20. Secretary, M. E. Cousin, 51, Rue de Clichy, Paris.

Szeged (Hungary) International Salon.—August 4–21. Particulars from Secretary, Magyar, Amatortenykepek Szovetsege, Csoporthonak, Szeged, Hungary.

Southern Counties Salon (organised by Camberwell C.C.).—August 11–31. Hon. Salon Secretary, W. Bertram, 45, St. Lawrence Road, Brixton, S.W.

South African Salon (Johannesburg).—August 26–31.

Hon. Secretary, Johannesburg Photographic Society, P.O. Box 7024, Johannesburg, South Africa.

Amsterdam International Salon.—Entries, August 1; open, September 14–29. Further particulars from Focus, Ltd., Fotosalon, Bloemendaal, Holland.

London Salon of Photography.—Entries, September 4; open, September 14–October 12. Further particulars from Secretary, London Salon, 5a, Pall Mall East, S.W.1.

R.P.S. Annual Exhibition.—Entries, August 16; open, September 14–October 12. Further particulars from Secretary, 35, Russell Square, W.C.1.

Irish Salon (to be held at Mansion House, Dublin).—Entries, September 14; open, November 2–9. Particulars from Hon. Secretary, Irish Salon of Photography, 18, Morehampton Road, Dublin.

Rotherham P.S. International Exhibition.—Entry forms due, September 23; prints, September 30; open October 16–19. Hon. Exhibition Secretary, E. George Alderman, Ruardean, Newton Street, Rotherham, Yorks.

Indian International Salon (promoted by Camera Pictorialists of Bombay).—Entries, October 1; open,

November 17–30. Hon. Salon Secretary, F. R. Ratnagar, Central Bank Building, Fort, Bombay, India.

G.W. Rly. "Camp Coach" Holiday Competition.—Prize, one week's holiday in camp coach during 1936 holiday season. Photographs should depict any aspect of camp coach holiday. Entries due, October 31. Further particulars from Superintendent of the Line, G.W.R., Paddington Station, W.2.

Canadian International Salon, National Gallery of Canada, Ottawa.—November 6–21, and afterwards in other Canadian cities. Entries due, September 20. Entry forms and further particulars from Exhibition Secretary, Canadian International Salon, National Gallery of Canada, Ottawa, Canada.

Cape of Good Hope International Salon (under the auspices of Cape Town P.S.).—Entries due, November 19; open, January, 1936. Hon. Salon Secretary, Richard Dekenah, P.O. Box 2431, Cape Town, South Africa.

Leicester P.S. International Exhibition.—Entries, January 24, 1936; open, February 24–March 7, 1936. Exhibition Secretary, H. Foscutt, 19, Doncaster Road, Leicester.

# How I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCXC.

Mr. R.  
GORBOLD.

From information communicated to our Special Representative.

"I COMMENCED my photography more years ago than I care to remember, as a schoolboy, with a half-plate camera. The little success that has been mine in the art of photography can be partly attributed to the training that was received by studying every picture well before making an exposure, when every exposure made deep inroads into slender pocket-money. In my early twenties pictures of mountains were the only ones that appealed, so the half-plate camera was carried with great labour among the hills, and up many

peaks that I should find it very difficult to climb now, even without any such encumbrance.

"During the war it was only possible to secrete a V.P.K. in one's kit, and instead of roaming the mountains, the scorching deserts and romantic cities of Mesopotamia and Persia were my lot. Pictures of strange men and places began to displace the mountains in affection, and it was found that photographs with a human interest had greater appeal. The advantages of a small inconspicuous camera were at once apparent, and this was long before the miniature camera became so popular. Though to-day I favour nothing smaller than  $3\frac{1}{2} \times 2\frac{1}{2}$ , I have never done better work than with the V.P.K. under the most trying conditions of heat and dust.

"To be successful it is necessary to specialise. Now changed conditions make wandering impossible, and as cacti growing is my hobby, the photography of that strange and eccentric family of plants has almost excluded any other branch of the art, and the half-plate camera has truly come back into its own.

"To my mind the negative is the foundation of the picture, and no amount of after-work can make up for a poor one. A good negative should have plenty of detail and be kept thin. A harsh negative will never produce a pleasing result. I am rather old-fashioned with regard to plates, and still prefer them to films; and I have used the non-filter variety ever since they were first introduced, and am not averse to using a screen with them. Sometimes a very special subject calls for a panchromatic plate, but I find, principally from a lack of skill on my part, that they give too hard a negative.

"The point of view and the lighting are the two elements that make a picture, and I often make a number of exposures on the one subject from slightly different angles under different lighting conditions, and scrap the poor ones. This may not be good craftsmanship, nor be economical, but I have never sought a 'big bag.'

"I am a believer in straight photography, for there is enough beauty in a good photograph for it to stand on its own merits. There is no need to worry whether photography is an art or not. Surely a good straight photograph is to be preferred to the gross imitation of some other pictorial art.

"A certain amount of mechanical or chemical control is permissible. The use of chiffon in enlarging to give softness and better modelling, the shading of a high-light or the holding back of a shadow is quite permissible, and even in extreme cases the printing-in of a cloud may be excused; but it all points to poor work on the original negative. The faking that calls into use a painter's brush and palette, and the wholesale combining of negatives that have no relation one to another, condemns the worker as one who has not mastered the art of photography."

(A further example of Mr. Gorbold's work is reproduced on one of the centre Art pages.)

A PERSIAN KURD.

R. Gorbold.

# Pictorial Analysis

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"THROUGH MORNING MISTS," by W. Howieson.

THE feelings of dignity and impressiveness are expressed with admirable strength and clarity in this picture of Howieson's, and, besides, the effects of morning mist and sunshine are delightfully rendered. Not only do these qualities enhance each other, each helping the other to show to full advantage, but they form a whole of decided pictorial attraction.

With the delicacy of tone in the middle distance and sky, the dark of the foreground both provides a note of vigour and strength and lends a sense of stability that is essential to the transmission of the feeling of dignity and height. In addition, it emphasises the aerial perspective i.e., the separation and distinction between the planes—and gives a proper value, which would otherwise be lacking, to the high key in which the remainder of the picture is set. The key itself is admirably calculated to bring out the suggestion of atmosphere and soft sunshine, and, though the distinctions are slight and subtle, they are nevertheless well defined.

Insomuch, this is attributable to the excellence of the craftsmanship. Only a sure technique has enabled the artistic qualities in question to be so finely recorded, and a like certainty of touch is discernible in the arrangement of the composition.

This follows conventional and traditional lines. The principal object and centre of interest is the church (1) with its three spires soaring gracefully into the sky. In the distance is another tower, which, though farther off, combines with the church to make an ensemble of good form, and, in a general sort of way, this group of spires and tower falls into a pyramidal arrangement. Apart from the strength of this form of composition, it accords most suitably with the nature of the subject, and, again, its strength is emphasised by its force of position. The highest spire happens to fall almost precisely

across two of the four intersections formed by divisions of thirds laterally and vertically. These form the strongest positions for the centre of interest in an arrangement of this type, and, as the other two points are not occupied by an item of any comparable significance, the dominance of the church is undeniable. It is definitely

In such circumstances, the unity of the picture is assured and the pictorial qualities—atmospheric mist and veiled sunlight—are displayed to the fullest possible advantage.

The sky, with its soft gradations and gradual lightening of tone towards the horizon, is appropriately luminous, a feeling that is stressed, to no uncertain degree, by the depth of tone in the foreground. The shapes of the masses of foliage, too, are generally made up of curves, and, in contrast to the straightness of the remaining lines, afford an essential relief.

The whole arrangement seems remarkably complete and finished. The effects are of considerable beauty, and, altogether, the picture is not only particularly attractive, but singularly free from any suggestion of any striving after effect or any of the freakish eccentricity affected by the self-styled modern school.

It attains its end by sound and straightforward methods, and that they are successful is demonstrated by the evident appeal the picture possesses and displays so well.

At the same time, and without in any way depreciating the existing rendering, it would be interesting to see the same subject treated under a different lighting and in a clearer atmosphere. What is in mind is one of those effects, when, under the influence of the sun shining from a low

altitude, such as occurs at early morning or late evening, the towers would shine with the radiance of light against a sky of somewhat deeper tone.

Such an effect would be exceedingly fine, and, if it could be secured it might make a companion picture to that now under discussion. In any event, the experiment would be helpful and educative, and is suggested if only as a means of indicating that the possibilities of such an excellent subject are scarcely exhausted by the existing representation.

"MENTOR."

the most prominent object in the picture, and, in a case like this, it would not greatly matter—assuming, of course, that no violent extremes of tone nor any similarly assertive shape were included—what form the remainder of the subject took.

As it stands, however, the other buildings fall into an harmonious arrangement, and the inclusion of the tower on the extreme right is fortunate inasmuch as it suggests a measure of imitation that further reflects the importance of the central object.

# PICTURES by Novices

## SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page

THE question of exposure—always a bit of a problem where subjects under artificial light are concerned—seems to have been adequately met in No. 1 of the prints reproduced on the opposite page. "Night Study," by H. W. E. Huxley, bears every evidence of a full exposure, for there is modulation in the deepest shadows, and, even in daylight, more could scarcely be expected.

### Exposure and Development.

It is the function of exposure to register the image of the subject on the plate or film. In effect, this is what is meant when we are told that exposure controls the density, but it is the degree of development that controls the contrast of the negative.

Each element of the subject has a certain light value, and, provided the exposure is sufficient and not too much, it will render these different values in the form of a latent image that is developable. Within quite reasonable limits the image will retain much the same values whether the exposure be the minimum or in excess of that minimum; but where the exposure has been only just enough the image will, as a whole, be thin, and where the exposure is full, it will be dense. If the image is thin, the deposit of silver, of which it is composed, will be comparatively slight, and if dense, it will be heavy, the degree corresponding with the relative exposure times.

Development, on the other hand, affects the contrast or the relationship of the tones with one another. A short development will produce a negative in which the difference between the greatest and least light action is slight and all the intermediate steps proportionate. A long development will increase the difference between the extreme and all the distinctions in between.

### Technical Fundamentals.

An appreciation of these two distinct functions is essential to good technique in negative-making; but, necessarily, the contrast of the negative must be adjusted to the range of the printing paper, for it is the print that forms the final criterion.

Printing papers are made in various types, and most types are subdivided

into grades—vigorous, normal and soft. Different makes, again, vary in their capacities, but, speaking generally, gaslight papers are about the shortest in their scale, i.e., they will provide a print of full gradation from a negative of low or slight contrast; bromide papers and chlorobromide papers have a medium range, and will give a satisfactory print from a negative that is more fully developed; and carbon, P.O.P., and platinotype are long in their scale of tones and need a negative of much greater contrast still.

One of these papers, no doubt, will be adopted as a standard, preferably of one of the normal grades, in order that there may be a margin either way. The time of development of the normal negative to give a fully-graded print on that grade must be found by experiment, and, thereafter, only varied to meet the demands of subject contrast as and when the occasion arises. It will readily be understood that a subject that is of greater contrast than usual will require a shorter time of development than normal, and vice-versa. It is also to be understood that the temperature of the developing mixture must either be kept constant or the time of development be adjusted to correct any variation.

### Practical Adjustments.

If the time of development of the negative is correct for the grade of printing paper employed, there will be a measure of gradation both in the lights and darks and in all the intervening steps of tone.

On the other hand, if the time is too short, the print will be too flat, or there will not be a sufficient difference between the extremes of tone. If the blacks are fully printed, the lights will be degraded, and if the printing is adjusted so that the lights just show the right degree of tone, the darker tones will not have a sufficient depth.

If the development time is too long, the contrast of the print will be excessive and either lights or darks will be deficient in tone.

"Night Study" is the sort of subject that would present a greater than normal contrast; but the fact

has, apparently, been realised and an adjustment made by shortening the time of development. This, however, has gone too far, and the print has just a suspicion of flatness.

### Depth in Printing.

Now that the negative is made, it is scarcely practicable to make any adjustment in its contrasts, for, although it might be intensified, there is some risk in the operation which it would be wise to avoid.

If, for example, the present print were made upon a normal gaslight, the fault could be corrected by using the vigorous grade, from which it will be gathered why it was previously suggested that a normal grade should be chosen as a standard. This procedure is far preferable to monkeying about with the negative, and, in passing, it may be recommended that the general printing depth should also be carried a stage or so farther in order to heighten the impression of night.

Nos. 7 and 8, "Farningham," by A. Humphrey, and "Foam," by F. M. Clements, go to the opposite extreme, and show an excess of contrast. Here a softer paper is indicated; but Nos. 3 and 6, "Low Tide," by W. Horry, and "The End of the Lane," by J. M. McCorquodale, are much better, and display prints that, in showing a proper degree of gradation in both lights and darks, indicate that the time of development of the negative has been correctly adjusted to the range of the printing paper.

Nos. 2 and 9, "Sky Breakers," by A. Procter, and "Downland," by F. N. Longhurst, seem also to be correctly developed for the printing paper employed, but printing itself does not appear to be carried quite far enough. A darker print, in each case, would be better; while, in connection with No. 4, "All Hands," by A. C. Boxall, a lighter print would show the figures to better advantage.

No. 5, "Lighthouse at Beachy Head," by H. F. Garrard, is just about right as far as the lower portion is concerned; but there is a patch of light at top left that is rather disturbing, and, in a case like this, an improvement could be obtained by a little local extra printing. "MENTOR."

# With the Beginners

## NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

### DEPTH OF DEFINITION.

A READER sent a reproduction of a photograph which was sharp from the nearest foreground to the extreme distance. How was it done? If he got near objects sharp the distance was fuzzy; when his distance was sharp, any near objects were blurred. How could he get everything sharp at the same time? Was it ever right to have either foreground or distance out of focus, and if so, when?

This reader is not the only one who has been up against the same difficulties, and the points involved are of considerable importance, and even the beginner must learn something about them, and know what to avoid, or he will certainly find himself collecting some very unsatisfactory results. It involves a certain amount of thought and arithmetic to get a grasp of the facts, but this is well worth while, and I will try to put the main principles and figures as simply as I possibly can.

#### Foreground and Distance.

To take the reader's last question first, I should say that if anything in the foreground is at all prominent or important it should never be fuzzy while the distance is sharp. We naturally see nearer objects more clearly defined and full of detail than distant ones.

It follows that we may often have softness and suppression of detail in the distance with advantage. It was easy for me to pick up a couple of similar illustrations of this point. In Fig. 1 the women and their immediate surroundings are sharp and clear enough, as they ought to be, but the distant bank of the river is subdued. There is nothing there that needs minute examination. In Fig. 2

Fig. 1.

Fig. 2.

the original print shows the most minute detail in the foreground, the nails in the boy's boots, the grain in the stone, and so on. Although the fountain is of importance it is not as sharp; but this adds realism to the moving water, and prevents its being too obtrusive. The distant buildings are still more diffused in definition—and a good thing, too.

#### Differential Focussing.

This is what is called differential focussing—getting some parts of the subject sharper than others. It is one of my grievances against miniature cameras with very short-focus lenses that the ability to do this is much more limited.

Then there are cases in which the principal objects are quite sharp, while both foreground and distance are not; but it is generally the case that, where this is permissible, the foreground is found to be simple and unimportant, so that its blurred detail passes unnoticed.

Many times, and even quite recently, there have appeared in these pages instructions for working out depth-of-focus tables, and I do not propose to go over the whole of that ground again. But I have worked out some actual figures on these lines, so that they may tell their own story, and show how useful a full table may be. The calculations were made at great speed, but I hope they are correct. They are given in round figures, as there is no need for hair-splitting in the matter.

#### Standard of Definition.

As has been pointed out many times, it is necessary to decide on a standard of definition before starting the calculations. In the days when few negatives were smaller than quarter-plate, and a 15×12 print was considered reasonable, it was usual to think that it was sufficient if a "point" did not measure more than 1/100th of an inch on

July 17th, 1935

the negative. Nowadays 1/300th of an inch is more usual. In the figures given below I have taken 1/200th of an inch as the standard.

It must be remembered that much depends on the lens. If this is of the single or R.R. type the definition may come up to this standard only in the middle of the negative, and fall off towards the edges. A "soft-focus" lens will not come up to standard anywhere.

### Hyperfocal Distance.

The most useful table to work out for a lens is one showing the "hyperfocal distance" for each stop. If the lens is focussed carefully on an object at this distance everything will be sharp from half that distance to the extreme distance—what is called "infinity."

Here is such a table for a 3-in. lens. In the first line are f/ numbers; in the second line the hyperfocal distances; and in the third line the distances beyond which everything will be sharp to the standard adopted. The f/ numbers are not repeated later, as they apply to all the examples given.

4.5	6.3	8	11	16
33' 4"	23' 10"	18' 9"	13' 8"	9' 4"
16' 8"	11' 11"	9' 4"	6' 10"	4' 8"

This shows that with a short-focus lens, especially with a small stop, it is quite easy to get good definition on both near and distant objects.

Next, here are similar figures for a 6-in. lens, and they tell a different story.

133' 4"	95' 4"	75' 0"	54' 8"	37' 4"
66' 8"	47' 8"	37' 6"	27' 4"	18' 8"

Not so easy to get "everything" sharp.

### Depth of Definition.

If we focus on a given distance, objects both nearer and farther will also be sharp. But how near, and how far?

Here are the limits (nearer and farther) for a 3-in. lens focussed at 10 ft.

7' 9"	7' 0"	6' 6"	5' 9"	4' 10"
14' 3"	17' 3"	21' 5"	37' 3"	I.

If the same lens is focussed for 20 ft. the distances are:

12' 6"	10' 10"	9' 8"	8' 1"	6' 4"
50' 0"	124' 4"	I.	I.	I.

Now for a 6-in. lens at 10 ft.

8' 8"	8' 3"	7' 11"	7' 4"	6' 6"
11' 9"	12' 8"	14' 1"	15' 9"	21' 7"

And the 6-in. lens at 20 ft.:

15' 5"	14' 1"	13' 0"	11' 6"	9' 8"
28' 7"	34' 7"	42' 10"	74' 6"	I.

It is not necessary to go into detailed explanations; the figures speak for themselves. It is easy to see the conditions which favour great depth of definition, and the reverse. Every beginner should work out a table for himself, according to (a) the standard of definition he requires; (b) the focal length of the lens; (c) the stop used; and (d) the distances marked on the focussing scale.

W. L. F. W.

## Treating Gross Under-Exposure

By LESLIE W. BOLTON.

To secure a passable print from an apparently hopeless negative.

WHEN as good a print as possible must be made from a badly under-exposed, under-developed negative, the following method can be tried with advantage. It makes use of the fact that when the negative image is bleached white (as in several of the intensifying processes) much more detail can be seen in it than when the same negative is black. If that detail can be seen it can be photographed, and a new and better negative can thus be made by copying.

Mercuric chloride is best for whitening the negative. This is a very poisonous substance, but most chemists will supply 1/4 oz. (3d.) which is enough for several negatives. It will be necessary to state what it is for and to sign the "Poisons Book." A little pure hydrochloric acid

is also required to assist the bleaching action.

It is important to wash out every trace of hypo from the film before applying the mercuric chloride solution. The exact strength of this is immaterial, but 12 oz. of water to the 1/4 oz. of mercuric chloride is about the usual proportion. Add a few drops of the hydrochloric acid to this solution, and place the negative in it. When the negative has bleached quite white take it out, wash again and set aside to dry.

On to a suitable copying board pin a piece of black velvet. Brush off any fluff that may be sticking to it, then fasten the negative down to it with drawing-pins. The white negative will now appear as a positive. Place the emulsion side down to the velvet, or the

new negative will be reversed from side to side. Set up the board in an even light and copy this positive with the camera, using a slow plate.

The resultant negative will be considerably better than the original one. As long as the detail has been improved in this manner the process can be termed successful, as the required density can easily be obtained by intensifying, or a vigorous gaslight paper used for making the final prints.

The process will at least improve negatives that have had considerably less than one-tenth of the correct exposure, but no method of after-treatment can compensate for extreme under-exposure, and the scale of tones must suffer. Nevertheless, this process is of considerable value.

## A Gum-Bichromate Formula

ALTHOUGH the gum-bichromate process is not practised extensively to-day, the pictorial workers who employ it make pictures of remarkable quality and beauty. One of the most successful exponents of gum-bichromate is J. Harold Leighton, whose exhibits in this printing process are among the most attractive pictures in the London Salon every year. Recently this worker gave a practical demonstration to the members of the Manchester Amateur Photographic Society, and the

following brief description is culled from the pages of the Society's bright little monthly journal:

The process necessitates the sensitising of the paper, of which Mr. Leighton considers Johnson or Autotype the most suitable. For this purpose, he says that after years of searching for a suitable sensitiser he hit upon the following, which he still uses, applying it with a hog's hair brush: 5 oz. gum arabic in 8 oz. water, add 5 or 6 drops carbolic acid, which is then used as follows:—

4 drams pigment (drop black).  
4 drams gum arabic, as above.  
8 oz. bichromate (10 per cent solution pot. bichromate).

The paper, after sensitising, can be kept for some days. The exposure by contact can be as little as twenty minutes in good daylight or as much as forty minutes upward in poor, and the development is done by washing in cold water, or if need be for quicker working in warm water. Finishing touches can be added with the pigment.

# Picture Points for Beginners

by RICARDO

## Photographing from Heights.

**D**ISAPPOINTMENT in photographs of views taken from great heights can generally be attributed to one or two facts. The impression of height is either not conveyed in the print, or else the view has been dwarfed and is not so clear as it was to the eye. The last two failings can, in the main, be remedied by using a long-focus lens and a film with a suitable filter to penetrate what haze is present. This will also give a little more contrast in the usually flat tones of the landscape.

Pictorially, however, much can be done, even when using the usual lens and film, by including some foreground and sometimes a figure. If the scene is similar to the sketches shown a horizontal or "landscape" picture is better, because in the upright view the subject is divided horizontally too many times, with a consequent loss of interest.

Choosing the horizontal view and stepping back to include a little foreground makes a more satisfying picture, and immediately gives the impression of great height.

## Maintaining Interest in the Picture.

**T**HE interest in a picture depends largely on the "lines" of the subject matter. If the interest is to be held, the essential of all pictorial photographs, the lines should guide the eye into the picture gradually up to the main point of interest. In the sketch on the right, the bridge, which dominates the picture, has a wedge shape and takes the eye immediately to the left and right out of the picture. Even the clouds, which also possess "lines," point in the same direction, and do not help in maintaining interest. Clearly, a stopping point is indicated which will return the eye into the picture and give it some pictorial interest. This is where a figure can be very helpful. Make sure that he or she is looking towards or into the picture, and not in a too prominent position; otherwise the interest will be divided between the figure and bridge. Notice, in the left sketch, how the clouds, which point towards the right, also help to counteract or "oppose" the lines of the bridge.

The direction of the sun can do much towards the modelling of the subject. In the sketch on the right the sun is over the right shoulder, throwing the whole bridge into shadow, and making a light foreground. In the left-hand picture the sun is to the left front, giving a more pleasing effect and a dark foreground.

## Choosing the best Viewpoint.

**I**T is a good thing to remember in pictorial photography that in almost every picture the best viewpoint is only to be found by searching. Very seldom is the first view seen the best. In the sketches shown the viewpoint has been altered, not only by moving to one side, but by lowering the camera as well.

The main criticism against the top sketch is that by choosing a point in the centre of the path the eye is led immediately straight towards the end of the path, and past the trees. These appear like so many telegraph poles, monotonously regular on each side, thereby missing the real motif of the picture, the trees themselves.

By moving to one side and placing the end of the path on one of the "thirds" we get variety into the tree-trunks, and, by lowering the camera, we cut out some of the uninteresting ground. At the same time, by raising the lens panel, or by slightly tilting the camera, we can add to the height and dignity of the trees. This is shown in the second sketch.

This point applies to almost every picture where there is regularity on either side, interiors of churches and cloisters, as well as avenues and streets.

In the sketches shown, it is immaterial whether the viewpoint chosen was either to the left or right, as both sides of the path are the same. But in a picture, say, of an interior of a church, looking down the nave, the lighting would probably decide the viewpoint, while in an interior of cloisters the viewpoint would be nearer the less interesting side.

# Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

## Making a Film of London By "ACTINOGRAPHER."

Now that the holiday season is in full swing, visitors from the country will be flocking in to secure *their* film record of the great metropolis. Our other cousins from across the Atlantic will be represented in force, too, and both will endeavour to return with a film that is at once representative and workmanlike.

A CINEMATOGRAPH film of London (or indeed, of any other great city) may be qualified by abstract treatment or it may be produced as a documentary pure and simple.

In order to avoid difficulties, amateurs about to essay their first production of city life should concentrate upon the documentary or travelogue treatment.

### Good Examples.

Probably the most meritorious travelogue familiar to established amateurs is the "super" entitled "London" (now available in the Pathéscope 9-mm. library). Since this is reproduced on one reel only, it should not be difficult for unacquainted visitors in London to persuade their dealer to run this film through the projector. A great many hints and suggestions for compiling an equally satisfactory record may be observed in other ways, though plagiarism is not helpful, and is besides in despicable taste.

Amongst other films that may with advantage be seen are several praiseworthy examples in the 16-mm. libraries, where they can usually be identified by their class groupings and titles.

Apart from what can be learned from viewing these productions, it is necessary to avoid in one's own effort both haphazard and slapdash filming. Always make certain that you are filming from the best viewpoint, that you are making use of a convincing shot, that the lighting could not be improved by waiting until a later hour in the day—or an earlier one to-morrow—that you are getting all the "close-ups" you can, and that you are preserving some sort of continuity throughout.

Particularly remember to be very painstaking when filming about those places in which you and your friends at home possess an unusual interest. You can shoot off as many feet as you like in Trafalgar Square, but if you go back without an equal footage of Cheapside (where great-great-grandfather lived in 1782) your film isn't going to be nearly so popular.

### Places of Interest.

All the familiar places of interest will be found enumerated in recent guide-books, but there are newer features and objects of appeal continually coming

into being—even after the latest guide-books have left the printers. For example, attached to a building on the Thames Embankment is London's largest clock (a peculiar, modern thing), and there are the new glass-fronted buildings—before which you can film perfect reflections—which have come to ornament Fleet Street.

Objects of unusual interest are the various market places, Covent Garden, Billingsgate, Smithfield, Caledonian and the street markets, the Borough and Leadenhall. Most of these are picturesque, and all warrant attention, despite inadequate mention in the guide-books.

Perhaps the most picturesque of the popular objectives is the Tower. Indeed, it is possible to shoot off many reels of film on this historical pile and its immediate surroundings, but by far the best shots are those to be secured from the south or river side, where both

lighting and scenery are ideal. Moreover, a steady "pan" will bring into view the majestic Tower Bridge and traffic on the busy river, whilst there is much scope for angle shooting on the Tower itself.

### Lesser Sights.

There are many peculiar and interesting churches in the immediate neighbourhood of the Tower, perhaps the best known and certainly the most frequented of which is All Hallows in Byward Street. The church has many Roman and other historical associations, the most recent of which are those connected with Toc H. And all those who had the ill fortune to pass through Poperinghe during the war will know what "Toc H" means.

Dance-bands and theme-songs have popularised the red-coated military guards to such an extent that no film

Haymaking has now commenced in many parts of the country, and it is a typical summer-time action subject that every amateur cinematographer should include in any film of country life.

would be complete without a brief shot or two of these much-maligned stalwarts. Such shots may be secured on the Horse Guards' Parade in Whitehall and at Buckingham Palace, and, indeed, at all the places mentioned in the ballads of Miss Cicely Courtneidge and her unworthy imitators.

It is more than likely, however, that your best shots will be those secured of the little "out-of-the-ordinary" sidelights which are not mentioned in the guide-books nor exploited in professional pictures. Be ever on the look-out, then,

for true pictures of London life as it is to-day, with the fast disappearing traffic policeman, with the gaiety of the larger parks—aye, and with the disconsolate misery of the poorer suburbs.

#### Technical Notes.

Attention has already been drawn to the desirability of securing abundant close-ups. Further improving effects can be secured by the employment of angle shots. These will be found especially useful in the crowded market areas, for besides being good cinematography they will enable considerably more action to be included—straight or ordinary shooting being particularly restricted in its ability to cope with crowded close-ups or mid-shots.

If there be much light about, most of the filming can be done on panchromatic stock, but in dull or cloudy weather an equally fast *ortho* emulsion will be found to give greater contrasts and more brilliant screen images. In all cases, of course, it is necessary to take frequent and careful readings of the light intensity.

## Women and the Ciné Clubs

By  
M. A. LOVELL-BURGESS.

THE number of young women who are taking an active, other than a film star, interest in amateur ciné clubs is on the increase. Five years ago women members of a ciné club were regarded as decorative rather than intelligent assets. The only woman secretary of an amateur ciné club five years ago was, I believe—but I am open to correction—Miss Pat Anstey, of the Finchley Amateur Ciné Society.

Things have changed since then. Ciné clubs which have women as secretaries now include Aristos Amateur Photoplays (Richmond), the Blackheath Film Club, the Bognor Regis Film Society, the London Amateur Film Society, the Sudbury Amateur Ciné Society, the Derby and District Ciné Society—this society lent 9.5 films to the Finchley Club on July 1st—the Neo Film Club (North London) and Finchley F.A.C.

It was a woman member of the Eastbourne Amateur Ciné Enthusiasts' Club who won this club's summer competition last year with a solo 16-mm. effort.

The Finchley Amateur Ciné Society are maintaining their feminist pioneer tradition, not only by continuing to have a woman secretary, but also by encour-

aging Miss Joan Huggins, star of so many F.A.C.S. productions, to turn producer. She is directing "The Road to Peace," a 16-mm. problem picture.

Women amateur cinematographers have won awards in national and international contests for brilliant solo interest films, but this is the first time I have heard of a woman producer of a corporate club effort. Are there other women club directors, I wonder? Women often lend a hand in making club "props" and costumes, but I have yet to hear of a club "camera-woman"!

Women have for so long lent a fugitive beauty to film productions, professional and amateur. Now let them also aim at making a worth-while intellectual contribution as well.

#### Story Film for Summer Session.

It has happened again! A club which set out to help and encourage solo workers has fallen to the lure of the story film. Members of the Eastbourne Amateur Ciné Enthusiasts' Club have decided to make a story film this summer. The film is to be made on 9.5-mm. stock, provided by the club, and shooting will begin as soon as the author's permission is received.

The F.A.C.S. is keeping members together during the summer by means of summer outings and a holiday film competition. Regular weekly programmes were discontinued after July 1st, but the studio is open each Monday evening as usual to afford an opportunity for general discussion or the showing of members' films.

In conjunction with the holiday film competition it has been decided to hold an exhibition of "stills" in view of the apparent activity with "still" cameras which has been noticed lately. It is felt that this informal exhibition will afford an excellent opportunity for members to see the work of one another and to discuss photographic matters generally.

Other ciné clubs, please note.

Recently, members of this club had a visit from representatives of R.C.A. Photophone, and the complete sound equipment was temporarily installed in the studio for inspection. On July 8th members paid a visit to Hackney Electrical Power Station.

Those interested in this club should get in touch with its Hon. Secretary, Miss T. Burrough, 64, Avondale Avenue, Finchley, N.12.

## Making a Summer Film

By  
"ASTON."

EVERY ciné amateur ought to make a film record of at least one picnic during the summer. For the scenic success of a "come and be shot" party you need a complete absence of formality. And remember that apparent simplicity is often the highest form of art.

Father, for instance, can be allowed to forget the picnic basket, or the car can be slowed down while the prettiest girl is sent back for supplies of ice-cream or cooling drinks. A solemn and reproachful dog "sitting up" at the improvised table and embarrassing each member of the party in turn with his unwinking stare will make an amusing sequence, and children in the party will provide plenty of unrehearsed incidents.

Whether your picnic party has for background country or sea you can weave something of loveliness into your impressions. The fascination of sea or

river for the cinematographer lies in its reflections and its ceaseless movement. For the worker in colour I recommend wind-swept wheat, a cottage garden, a brightly painted wagon in a sunlit lane. You will not be able to capture the fragrance of the new-mown hay, but in the years to be you will have power to "open a window" through which you and others may look into a vanished summer.

#### Making an Interest Film.

There has been so much necessary insistence on action in the making of interest films, so much stress on movement in the foreground of a scene, that the ciné amateur is almost afraid to introduce a "still."

I find the secret of success in using stills in an interest film lies in the value of dramatic contrast.

You have, for example, filmed gay

scenes on a river. It may have been a boat-race, or the merry parties that glide up and down the waterways on a summer afternoon. Do not be afraid to end your film with a quiet picture of sunset and cloud formation. If there happen to be boats in the foreground so much the better, for their silhouette value, but it is sufficient for your purpose to film the still river, the clouds, the reflection, the bright, narrowing pathway to the setting sun.

There is something particularly pleasing and restful to the eye, after shots of a noisy street and human action, to see the city by moonlight, the dark outline of the bridge spanning the river, the lamps jewelling the dim and solitary streets.

Such studies, however, should be character studies, in that they suggest the atmosphere and the associations that you wish them to convey.

## The First Photographic Portrait

IN many articles in magazines and elsewhere dealing with early daguerreotype and other photographs, the claim is put forward that a certain Miss Draper was the first person to be photographed. The portrait on which this claim is based has been frequently reproduced.

Dr. Draper, the lady's father, was experimenting in New York with the new process of Daguerre, and he had succeeded in so increasing the sensitiveness of the daguerreotype plate by treating it with bromine that he considered the possibility of taking a portrait. The exposure must have been very long, and the light powerful; at any rate, he succeeded. This was in 1840.

At the beginning of 1839, Daguerre came over to England to exhibit some of his work in London. While staying with Mr. Lubbock he photographed his host's son, afterwards the first Lord Avebury. The fact that the result has not been produced or reproduced, as in the case of Miss Draper, does not disprove the statement published at the time that Daguerre had actually made such a portrait; and if the fact is admitted it disposes of the Draper claim, as Daguerre's portrait must have ante-dated Dr. Draper's by more than a year.

In any case, the matter is not very important, as neither of the portraits mentioned was the first to be taken with a camera.

At the end of 1854 Fox Talbot entered an action for infringement of his rights, and among the witnesses called for the defence was a Buckinghamshire vicar, the Rev. J. B. Reade. It was he who in his photographic experiments discovered the use of gallic acid as a sort of developer of the image on the sensitive paper then in use, making it much more rapid.

The second volume of the Journal of the Photographic Society of London (now the R.P.S.) contains a report of Mr. Reade's sworn and unshaken evidence at the trial, and in it occurs this passage:

"He had taken in the camera representations of hyacinths in flower, and a bust of Pitt he had taken two or three times; and he had taken a representation of his greenhouse and the gardener leaning at the end of it. This was *previous* to 1839."

Whether this unnamed gardener was the first person to be photographed it is impossible to say; but there is no reason to doubt that he ante-dated both the youthful Lord Avebury and the fair Miss Draper. It seems evident that the Talbot process was speeded up sufficiently to enable portraits to be taken while Daguerre's method was still too slow to make this practicable, although the necessary sensitiveness was afterwards secured and daguerreotype portraits had a vogue for many years. W. L. F. W.

## The Week's Meetings

### Wednesday, July 17th.

Luton and D.C.C. P.L.A. River and Docks Cruise.  
Rochdale P.S. Visit to Watergrove. Meet Broadway for 7.45 p.m. bus.  
Southend-on-Sea and D.P.S. Great Wakering.  
Stockport P.S. Portfolio by F. G. Curson.

### Thursday, July 18th.

Hammersmith H.H.P.S. "People I have Shot." J. Jarcho.  
N. Middlesex P.S. President's Evening.

### Friday, July 19th.

King's Heath and D.P.S. "Journey to Switzerland." L.N.E.Rly.

### Saturday, July 20th.

Bayswater and Paddington P.S. Regent's Park Zoo.  
Blackburn and D.C.C. L. and C.P.U. Bury.  
Hanley P.S. Wall Grange.

South London P.S. Criticism Evening.  
Walthamstow and D.P.S. Temple. Meet at Chancery Lane, 6.30 p.m.

### Tuesday, July 23rd.

Leigh Lit. Society P.S. Dean Dam.  
Northants N.H.P.S. Salcey Forest.

## A Competition specially for Novices

### SUBJECTS.

Prizes will be awarded for the best snapshots of family groups or single figures taken at home or on holiday, indoors or outdoors. The arrangement of the groups or the pose of the figures is left entirely to the discretion of the competitor.

The competition is open only to novices: those who have never won an award of any description in a photographic competition. Entries are restricted to contact prints. The smallness of the prints, which may be mounted if necessary, will not affect their careful consideration in this competition.

### PRIZES.

The prizes will consist of supplies of roll film or of plates (if any winner happens to use a plate camera).

THE FIRST PRIZE WILL BE TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.

THE SECOND PRIZE WILL BE TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.

THE THIRD PRIZE WILL BE ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.

TWELVE PRIZES OF ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

The winners of these prizes will thus be encouraged to continue their photographic activities throughout the year with a supply of free film.

### RULES.

Each print must have affixed firmly to the back, a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor.

The latest date for receiving entries is September 7th, 1935. This will give new readers, who are novices, who intend entering this competition every opportunity of improving their work during the next three months by reading "The Amateur Photographer" every week and obtaining their competition prints during the summer holidays.

The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed as follows: The Editor, "The Amateur Photographer," Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices' Competition."

Further references to the competition will be made week by week, and hints given for the best treatment of groups and figures.

# Readers' Questions ANSWERED

**GENERAL.**—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

**CONTRIBUTIONS.**—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, and in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

**ENQUIRIES AND CRITICISM.**—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a *separate* stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

## Selling Prints.

Can prints from the United Kingdom entered for the Salon have prices attached? If so, what is the method of sale? H. A. S. (London.)

Pictures from the United Kingdom accepted for the Salon exhibition may have prices attached. In that case the price is given in the catalogue, and in the event of a sale resulting 15 per cent of the price is deducted.

## Bromoil.

I read that in bromoil work bleaching, inking, etc., can be done by artificial light; can they be carried out in daylight? D. M. (Glasgow.)

Once the bromide print is finished the whole of the operations to which you refer can be carried out either by daylight or by artificial light.

## Use of Filters.

I use two kinds of film, and the makers of each recommend their own filters? Why? Would not one filter work with both? K. C. M. (London.)

The reason why makers of plates and films recommend certain filters is that they know the characteristics of the emulsion and what effect these filters will have. To a great extent filters are interchangeable, and in many cases quite satisfactorily. One thing to remember, however, is that the factor of a filter with one emulsion may be very different from its factor with another.

## Loading Films.

I put panchromatic cut films into sheaths before loading them into the slide, but it takes me about fifteen minutes to do in darkness. Can you help me? W. G. K. (Ware.)

Assuming that you put your film in a carrier, which is certainly no thicker than a glass plate, we do not see where your difficulty arises, as a plate can be put into a single metal slide in darkness in a second or two. The only thing we can suggest is that you practise the movements in daylight, and then try with your eyes shut till you can dispense with sight and rely on touch.

## Keeping Solution.

If I make up the following solution how long will it keep in good condition? H. C. (Haslemere.)

We have no information that would enable us to answer your question as to the keeping properties of the developer. It is the sodium sulphite that gradually deteriorates, but there is no forecasting the time occupied before this deterioration has an adverse effect on the working of the developer. We think that the small quantity you mention should keep in perfect working order for a longer time than you are likely to keep it. In practically all cases of deterioration there are warning signs of what is happening, and it is better to waste the remains of a solution rather than run risks.

## Black Prints.

I have started making my own prints, but can only get sepia tones. Can I get black tones on printing-out paper? If so, what is it, and how is it used? N. C. L. (Norwich.)

There is no printing process you can adopt that will give you really black-and-white prints by daylight. This result can be most easily obtained by bromide or gaslight paper, and if you buy some of either you will find sufficient instructions accompanying it to help you to work it successfully.

## While-you-wait Work.

Will you give me a formula for combined developing and fixing salts for while-you-wait work? D. D. (Thomastown.)

The processing methods for "while-you-wait" photographs cannot be dealt with in the form of a reply to a question, and you must get the proper formulae and methods of procedure from suitable textbooks. A firm which specialises in this particular class of work is Messrs. Jonathan Fallowfield, Ltd., 61-62, Newman Street, Oxford Street, London, W.1.

## Use of Meters.

Do electric meters work on the light brightness of the scene or give the actinic photographic value? For instance, a bright day in April and one in August would make a big difference. I have a Wynne meter but have a difficulty in getting paper for it. Is it out of date?

J. A. W. (Cathcart.)

It does not matter in the least what is the month or time of day when using such meters, as, naturally, the meter responds to the light present, irrespective of date. The Wynne meter is an actinometer, and you must have with it the proper sensitive paper and an up-to-date speed list. Both of these you can obtain through a dealer, or from the Infallible Exposure Meter Co., Wrexham. The meter is by no means out of date.

## Miniature Negatives.

Would it be any use enlarging miniature negatives with a view to entering competitions and sending pictures to the Press? F. B. B. (Shorncliffe.)

There is no reason why enlargements such as you mention should not be satisfactory either for competition or Press purposes. A great deal, of course, depends on the lens of the camera you use, and still more on your ability to find sufficiently good and suitable subjects.

## Grain in Negative.

What is the cause of the very objectionable grain on the enclosed enlargement? I send the negative and technical details. L. T. H. (Hemsworth.)

There was no negative with your communication, and, as this is more important than the print, we do not like to pass any opinion. Some of the particulars you give have nothing to do with the case. The make of the camera, for example, is not at all relevant when it comes to a question of grain in the negative. We are, in fact, quite at a loss to understand why the print you send should be so very bad in this respect, especially with so reasonable an enlargement as four diameters.

## Concentrated Developer.

I have made up the concentrated M.Q. solution as described in your pages recently, but it did not come out as it should. After adding the metabisulphite I got a clear solution without adding the caustic soda. Where have I gone wrong? S. V. (Sheffield.)

In reply to your query, we cannot understand why the formula given in the article referred to has not worked correctly. Provided the amounts that are given are followed precisely, the first part of the solution (before the caustic soda is added) ought definitely to show a precipitate and be cloudy. You will find that if the caustic soda solution is then added, the cloudiness will increase considerably until the entire solution is thick in appearance. The addition of the caustic solution should be continued until the precipitate has cleared, as the developer is not complete, and will not act until the soda has been added to the solution. If there is any doubt about the quality of the potassium metabisulphite, this can be replaced in the solution with anhydrous sodium sulphite of approximately the same quantity, say, 4 oz.; but you should observe that the slight precipitate or cloudiness increases when the caustic soda is first added.

# The London Salon of Photography 1935

**SENDING-IN DAY,  
Wednesday, September 4th**

THE TWENTY-SIXTH EXHIBITION promoted by the Members of the London Salon of Photography will be held at The Galleries of the Royal Society of Painters in Water Colours, 5a, Pall Mall East, London, S.W.1, from SATURDAY, 14th September, to 12th October, 1935.

## CONDITIONS OF ENTRY.

No. 1. Pictures from exhibitors in the British Isles must not be framed; but may be mounted. Each picture must bear on the back, clearly written—(a) name of artist; (b) number and title of picture; corresponding to particulars on the Entry Form.

No. 2. When mounts are employed, they should conform to the following sizes:—25×20, 20×16, or 15×12, but no mount to exceed 25×20; and it is suggested that white or light-toned mounts be employed wherever possible.

No. 3. Pictures from abroad must not be mounted (or framed), but should bear full particulars as above.

No. 4. Pictures which are sent unmounted will be suitably mounted by the Salon Committee, and all accepted pictures will be shown under glass.

No. 5. All pictures should be sent by parcels post, packed flat, and properly protected with stiff cardboard and adequate wrappings, addressed to: THE HON. SECRETARY, THE LONDON SALON OF PHOTOGRAPHY, 5A, PALL MALL EAST, LONDON, S.W.1.

No. 6. The sending-in day is Wednesday, September 4th, 1935. All pictures for the Exhibition must arrive at the above address on or before this date. Exhibits may be delivered by hand at the Gallery on this date only.

No. 7. The Entry Form, properly filled in, must be sent with the pictures, together with entry and packing fee of 5/- (this fee covers any number of pictures from one exhibitor).

No. 8. To avoid Customs complications, all entries from without the United Kingdom must be sent by post and without prices marked on the prints. Packages containing such entries should be clearly labelled: "Photographs for Exhibition Only. No Commercial Value. To be Returned to Sender."

No. 9. All pictures sent by post will be repacked and returned, carriage paid, after the close of the Exhibition.

No. 10. In view of application being made from time to time to The London Salon of Photography for permission to reproduce pictures from the walls of the Gallery, exhibitors are asked kindly to signify on the Entry Form whether they have objection to such permission being given. The copyright, in all cases, remains the property of the authors of the prints.

No. 11. The Committee assure intending exhibitors that the utmost possible care will be taken of all work submitted, but they do not accept any responsibility for loss or damage, either during transit or at the Gallery.

The submission of pictures will be understood to imply acceptance of the above conditions.

Due notification of acceptance of pictures will be sent out as soon as possible.

All work submitted to the Selection Committee will be carefully and impartially considered, and no preference will be given to pictures by Members of the Salon.

Entry Forms and further particulars from the Hon. Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.

# Rolleicord

## A ROLL-FILM AND REFLEX CAMERA COMBINED

You want to bring home beautiful holiday pictures—Rolleicord will not let you down. It will achieve for you everything that is possible in modern photography. It shows you your picture full size on the ground-glass screen right way up; you see it as clear as the finished snap, and if you do not care for the view, you can reject it *before* you waste the film on it. The Compur shutter has only one lever for setting and releasing. Shutter speeds and stops are simple to adjust—in fact, every detail of the Rolleicord is built for ease in manipulation. It takes 12 pictures on 8-exposure  $3\frac{1}{4} \times 2\frac{1}{4}$  roll film for 1s., and can be adapted for plates. With leather-covered body and f/3.8 Zeiss Triotar lens  
**£12 : 15 : 0**

YOURS FOR

**29/9**

and 8 similar monthly payments.

Rolleicord (as illustrated on right) is also available with f/4.5 Zeiss Triotar lens and one-lever Compur shutter. With metal-finished body. For roll films only.  
**£10 : 10 : 0**      Nine monthly payments of **24/6**

**VERY GOOD ALLOWANCE ON YOUR USED  
CAMERA in PART PAYMENT for the ROLLEICORD**

We recommend Rolleicord as easily the best of the popular-priced twin-lens reflexes. It is a real precision instrument.

## WALLACE HEATON LTD.

## Business Notices

### Publishing

**OFFICES.**—Dorset House, Stamford Street, London, S.E.1. Telegrams: "Amaphot, Sedist, London." Telephone: Hop 3333 (50 lines).  
**PUBLISHING DATE.**—"The Amateur Photographer and Cinematographer" is on sale throughout the United Kingdom every Wednesday morning.  
**SUBSCRIPTION RATES.**—British Isles 17/4 per annum, Canada 17/4, other countries abroad 19/6 per annum, post free.  
**REMITTANCES.**—Cheques, etc., should be crossed and made payable to Iliffe and Sons Ltd. "The Amateur Photographer" can be obtained abroad from the following: **UNITED STATES:** The International News Co., New York. **FRANCE:** W. H. Smith & Son, 243, Rue Rivoli, Paris; Hachette et Cie, Rue Reaumur, Paris. **BELGIUM:** W. H. Smith & Son, 71-75, Boulevard Adolphe Max, Brussels. **AUSTRALIA:** Gordon & Gotch, Ltd., Melbourne (Victoria), Sydney (N.S.W.), Brisbane (Queensland), Adelaide (S.A.), Perth (W.A.), and Launceston (Tasmania). **NEW ZEALAND:** Gordon & Gotch, Ltd., Wellington, Auckland, Christchurch and Dunedin. **INDIA:** A. H. Wheeler & Co., Bombay, Allahabad and Calcutta. **CANADA:** Imperial News Co., Toronto, Winnipeg and Vancouver; Benjamin News Co., Montreal; Gordon & Gotch, Ltd., Toronto. **SOUTH AFRICA:** Central News Agency, Ltd.

### Displayed Advertisements

Communications on Advertisement matters should be addressed: The Advertisement Manager, "The Amateur Photographer and Cinematographer," Dorset House, Stamford Street, London, S.E.1. Copy for displayed advertisements for the issue of any particular week must reach Dorset House by the first post on Tuesday morning in the week previous. Rates and conditions will be sent upon application.

### Prepaid Advertisements

**SALE AND EXCHANGE: AMATEURS ONLY—**  
 12 words or less.....1/-  
 1d. for every additional word.  
**PROFESSIONAL AND TRADE:—**  
 12 words or less.....2/6  
 2d. for every additional word.

Each paragraph is charged separately.

**SERIES DISCOUNTS** are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.  
 All advertisements inserted in these columns must be strictly prepaid and posted to arrive at the Head Office, Dorset House, Stamford Street, S.E.1, not later than first post FRIDAY for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 26a, Renfield Street, Glasgow C.2.

Advertisements are inserted, as far as possible, in the order received, and those received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders sent in payment for Advertisements should be made payable to **ILIFFE AND SONS LTD.**, and crossed

& Co.

Notes being untraceable if lost in transit, should not be sent as remittances.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

**BOX NUMBERS.**—For the convenience of advertisers, letters may be addressed to numbers at the office of this paper. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charges, which must include the words: "Box 000, c/o 'The Amateur Photographer'." Replies should be addressed: "Box 000, c/o 'The Amateur Photographer,' Dorset House, Stamford Street, London, S.E.1," and these letters will be simply forwarded by us to the advertiser. It must be understood that we do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisement. Readers who reply to Box No. advertisements are warned against sending remittances through the post except in registered envelopes. In all such cases the use of the "Deposit System" is recommended.

### Special Note

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

### Deposit System

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Amateur Photographer and Cinematographer," both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10 a deposit fee of 1/- is charged; on transactions over £10 and under £50 the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, one-half per cent. All deposit matters are dealt with at Dorset House, Stamford Street, London, S.E.1, and cheques and money orders should be made payable to Iliffe and Sons Ltd.

## CAMERAS AND LENSES

**DALLMEYER** V.P. Focal-plane, f/2.9 Pentac, 6 slides, filter, case, developing tank, £7/10.—Below.

**WEENY-ULTRIX** Film Camera, f/4.5, Compur, filter, purse, £4/10.—I., 28, Kendall Avenue, Sanderstead, Surrey. [8151]

**£2** 1-pl. Sanderson, Ensign anastigmat lens, sector shutter; recently completely overhauled.—Box 4630, c/o "The Amateur Photographer." [8267]

**1-PLATE** Sanderson, Cooke f/6.5, speeded shutter, 2 3 B.F. slides, hooded screen; perfect condition, stiff canvas case, £5.—Steel, 1, Boundary Terrace, Carlisle. [8268]

**1-PLATE** Salex, focal-plane shutter, f/4.5, 6 slides, 4 F.P.A., £4; also Gaumont Blocknote 6x4 1/2 cm., 6 slides, stiff leather case, £2; both perfect condition.—Warren, 133, Church Rd., Hanwell, W.7. [8272]

**ICARETTE** 2 1/2x2 1/4, Tessar f/4.7, 2 cases, 35/-.—Dunlin, Corkwell St., Chatham, Kent. [8273]

**SOHO** Reflex, postcard size, 6 book-form slides, 1 adapter, leather case, Goerz lens, £10.—Whincroft, Market Avenue, Chichester. [8274]

**3 1/2x2 1/4** Zeiss Ikon, f/4.5 Tessar, D.A. Compur, D.E., slides, cut-film sheaths, F.P.A., latest light-trapped roll-holder, F.P. developing tank; used twice; cost £15 last season and absolutely perfect, £8/15.—12, Charlton Rd., Sunderland. [8284]

## WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

## CAMERAS AND LENSES

**ENSIGN** Sector II, postcard size, film-pack and plate adapters, Zeiss Tessar f/6.3, in leather carrying-case, £3/10.—Box 4675, c/o "The Amateur Photographer." [8278]

**BARGAIN.**—1-pl. D.E. Zedellar, f/3.8 anastigmat lens, Compur shutter, 1 to 1/200th, rising and cross front, slide, F.P.A., case, £3/10.—Box 4676, c/o "The Amateur Photographer." [8279]

## CAMERAS AND LENSES

**9x12** Zeiss Ideal Camera, f/4.5 lens, Compur shutter, and 6 slide cases, complete in stout hide leather case, also F.P.A.; as new; can be seen by appointment.—S., Donovan Avenue, Muswell Hill, N.10. Cost over £20; accept £15.—Goyder Smith. [8281]

**F/2.9** V.P. Film, newest model Planovista double-lens Folding Reflex, synchronised focussing, D.A. Compur, 1/250th sec., in case, unused; cost £10/7/6; accept £9/10; sent on approval against cash.—E. G. P. 10, St. Dunstan's Rd., Baron's Court, London, W.6. [8282]

**VICTORIA**, Meyer f/2.9, in D.A. Compur, 16 on 2 1/2x3 1/4, practically unused, £4/10.—Fournier, 369, New King's Rd., S.W.6. [8283]

**3 1/2x2 1/4** Mentor, 1/14th to 1/1,3000th, Aldis f/4.5, 3 1/2 focussing screen, F.P.A., 3 D.D. slides, Mackenzie-Wishart adapter and 6 envelopes; all in leather case, £7/10.—58, Tunstall St., Liverpool, 7. [8285]

**FOTH-FLEX** f/3.5 Twin-lens Reflex, 1 to 1/500th, focal-plane, self-taking attachment, 12 2 1/2x2 1/4 on 3 1/2x2 1/4 film, leather over-ready case, Drem meter, camera one month old; real bargain, £8; deposit system.—Jay, 60, Sicey Avenue, Firth Park, Sheffield. [8288]

**1-PLATE** Sanderson Hand or Stand, Goerz Dagor 4 f/6.3, 3 D.D. slides, leather case; all as new, £3 or offer.—Scott, 71, Bertram Rd., Hendon, N.W.4. [8289]

## CAMERAS AND LENSES

**31**×2½ Special Kodak, f/6.3 lens, Compur shutter, £2/10.—Jones, 852, Lea Bridge Rd., Leyton, E.10. [8290]

**DALLMEYER** ¼-pl. Reflex, Dallmeyer lens f/3.5, shutter 1/15th to 1/1,000th sec., 6 slides, leather case; whole as new, £7/10, or near offer.—Biggs, Winterborne Abbas, Dorchester, Dorset. [8291]

**NEWMAN-SINCLAIR** ¼-pl. Reflex, front lens shutter, ¼ to 1/10th, T. B., Zeiss Tessar f/4.5, 6-in. Ross Teleros f/6.8, 11-in., interchangeable, F.P.A., 6 D.D. slides, K 1, 1½, 3, G. and I.R. filters, sky-shade, leather case; good condition, £15; or would exchange for 3½×2½ Super Ikonta 530/2.—Lt.-Cdr. Baker, H.M.S. "Kellett," Sheerness. [8293]

**1-PLATE** Reflex Outfit, A.P.E.M., Wishart 4 daylight-loading slide, F.P.A., filter, tripod, case; condition good, £3/18/6.—J. T. Corney, 92, Albert View, Halifax, Yorks. [8294]

**ZEISS** Ideal 3½×2½, Tessar f/4.5, Compur, 6 holders, F.P.A., Distar, sky, colour filters, L/case; excellent condition, £7.—Below. [8295]

**KODAK** Six-20 Duo, f/4.5, Compur, L/case; almost new; cost £8/11/6, £6.—Below. [8296]

**TROPICAL** Sanderson ¼-pl., Ross Homo., Compur, 3 D.D. slides, case; excellent condition, £6.—Box 4680, c/o "The Amateur Photographer." [8296]

**SINCLAIR** Una, Traveller Model, 3½×2½, Tessar f/4.5, filter, Sinclair hood, F.P.A., block-form slides, leather case, £24; Automatic Rollei-flex 4×4, f/3.5 Tessar, filter, shade, leather case, £14; Avo Photo-electric Exposure Meter, in case, £2/10; perfect combination for serious amateur; seen London.—Box 4682, c/o "The Amateur Photographer." [8298]

**ZEISS** Ikonta, 16 on 3½×2½, Novar f/4.5, Telma D.A., unused, leather case, £4.—12, Dickinson Square, Croxley Green, Herts. [8301]

**ROLLEIFLEX** 6×6, f/4.5 Zeiss Tessar anastigmat, Compur shutter, 1 to 1/300th sec., yellow filter, canvas case; as new; used for 20 films only; approval deposit system, £9.—Kerslake, Hazel House, Kingsteignton. [8302]

THE  
**"Leudi"**  
 EXPOSURE  
 METER  
 PRICE ONLY  
**5/-**

Purse Case, 1/- extra.

Less than half the size of an ordinary pocket lighter is the LEUDI is easily the smallest and neatest exposure meter made. As simple as it is small, and as efficient as it is simple, it is the finest value in exposure meters that you can possibly obtain. It is as effective indoors as out of doors, and can be used with plates or films of any make.

Ask your dealer to show you a "Leudi."

## RETOUCHING

Trade.

RETOUCHING.—First-class work promptly executed.—Miss Lamb, 3, Orchard St., Canterbury. [6450]

# HAND CAMERAS

Third Edition

By R. Child Bayley

AN outstanding feature of this book, which makes a special appeal to all amateur photographers, is a number of separately printed plates, all from hand camera negatives by the author. These are selected to show the very wide range of subjects accessible to the snapshotter, from pure landscape to tele-photographic portraiture.

Though primarily written for the beginner, "Hand Cameras" contains much of interest to the advanced worker, and should be in the working library of all who would attain to the highest degree of artistic excellence in their work.

# Granville

## Products Produce BETTER PICTURES

All Granville Papers and Cards are subject to a strict process of testing before being offered for sale; every sheet being thoroughly examined before leaving our works. Granville Papers contain a high content of silver, and produce vivid sparkling prints. Speed, Latitude and Gradation are further characteristics which have made Granville Products so universally popular. Note the prices.

Supplied in 20 grades. Single or doubleweight.

# LEICA SPECIALISTS RIGHT FROM THE FIRST!

**1925**

The First Leica on the market, sold by Wallace Heaton in 1925.

## WHY TRUST your LEICA QUERIES TO THE INEXPERIENCED?

The slightest detail of wrong advice may spoil a whole batch of pictures which you may never have the chance of photographing again. Eliminate this risk by getting in touch with Wallace Heaton first.

## COME to the SPECIALISTS WHO UNDERSTAND LEICA from A to Z

Our long experience in Leica cameras is at your service. We have studied Leica in every detail: the high-precision focal-plane shutter—the interchangeability of lenses—the built-in range-finder—the automatic focussing—whatever you want to know about any Leica feature, we CAN explain.

### LEICA MODEL III

With f/2 Summar lens—the wonder camera, for shots by day or night. £39:10:0  
Nine monthly payments of 92/2.

### LEICA MODEL III

With f/3.5 Elmar lens. £30:10:0  
Nine monthly payments of 71/2.

## NEW 'SUPER IKONTA'

Takes 11 exposures on 3½×2½ 8-exposure roll film. Double exposures impossible. Zeiss Ikon latest pattern rotating wedge distance meter coupled to lens focussing. Rapid Compur shutter. Modern die-cast body. Elegant construction. With f/3.5 Zeiss Tessar lens

£25:5:0  
Nine monthly payments of 59/-

## NEW ENSIGN 'DOUBLE-8'

WITH ENSAR F/4.5 ANASTIGMAT

16 pictures on V.P. (Size 27) Film.

Features include hinged back, 3-speed Everset shutter, depth-of-focus scale, direct optical sighting view-finder. Fits comfortably in pocket or handbag. Remarkable value.

Price, including leather slip case £3:12:6

Nine monthly payments of 8/8.

## PRAISE FOR OUR LEICA SERVICE

"I think it only right to let you know how satisfied I am with your Leica service, which is both prompt and efficient. No-where else can I obtain such high-class work. The advice given by your technical department... is the best piece of help I have ever received." D. E.

## WIN 10 GUINEAS IN WALLACE HEATON'S 'LIFE PHOTOGRAPHS' COMPETITION

NO ENTRY FEE! Open to All

Here is a selection of prize-winning subjects:

Outdoor Subjects, Children, Animals, Pretty Girls, Old People, Old Craftsmen, and the like, Bathing Beauties, Figure Studies with Animals, Figure Studies and Genre Subjects generally.

Any size of print may be sent in. ALL must contain human life interest. Winning negatives become our property.

CLOSING DATE SEPT. 30th.

First Prize	Second Prize	Third Prize
£10:10:0	£5:5:0	£2:2:0

Hundreds of prizes of 10/6

... and you do  
**BEST OF ALL at—**

The new Leica IIIA, speeded to 1/1,000th sec., now at Bond Street. Showing that Wallace Heaton is STILL FIRST with Leica.

**1935**

## REGISTER YOUR LEICA with us for FREE SERVICE after PURCHASE

You will then receive periodical aids and advice of the greatest value, also free copies of "Leica News and Technique." Special Leica binders for preserving these "Leica News" are sold to Wallace Heaton registered customers at 1s. each.

## Our LEICA STOCK is BIG ENOUGH TO COVER ALL EMERGENCIES

Whatever you require—lenses, view-finders, developing tanks, Leica synchronised flashlamp, 12-exposure films, or any Leica model. Our stocks are large enough to meet every demand at once. There's no "waiting" when you order from Wallace Heaton Ltd.

### LEICA MODEL II

With f/3.5 Elmar lens. £26:10:0  
Nine monthly payments of 61/10.

### NEW LEICA IIIA

With f/2 Summar lens, and shutter speeded up to 1/1,000th sec., chromium finished. £43:0:0  
Nine monthly payments of 55 9s. 4d.

## 'KODAK' RETINA

A high-precision camera taking 35-mm. film. Daylight loading with Kodak cassettes—3/6 for 36 exposures. Easy to use. Quick in operation. With Schneider Xenar f/3.5 lens in Compur shutter 10 Gns. Nine monthly payments of 24/6.

## ROLLEIFLEX

The world's fastest roll-film mirror reflex. Shows you your picture full size on ground-glass screen, even while you are making the exposure. Has f/3.5 Zeiss Tessar lens and Compur shutter speeded to 1/500th sec.

£22:10:0

Nine monthly payments of 52/6.

## ZODEL DE LUXE With ALL-METAL Body

A splendid high-class instrument. Built for good wear. Small and compact. Rising and cross front. Double extension. For 3½×2½ plates. Fitted with high-grade f/4.5 lens and Compur shutter.

£6:17:6

Nine monthly payments of 16/1.

## EASY TERMS

The first of nine monthly instalments secures any purchase. Only 5 per cent added, or 5s. if under £5. Buy now this easy way.

## A Rolleiflex Picture

Aren't the photographs you treasure most those you've taken while on holiday? Imagine how priceless the picture of these two bonny little chaps will be in ten years' time. . . You're going on holiday? See to it that you take the best camera. Rolleiflex is best, for the following reasons: it is easily manipulated; the focussing is minutely critical; the picture can be seen actual size while you are focussing and adjusting your "speed" and "stop"; full compensation for parallax is allowed; reflex quality pictures with the cheapness and convenience of ordinary roll film. Rolleiflex gives 12 pictures on an 8-exposure  $3\frac{1}{2} \times 2\frac{1}{4}$  roll film, for 1/-. Compur shutter speeded up to 1/500th sec. (one lever only for setting and releasing). Plate adapter and numerous accessories, make Rolleiflex the perfect miniature camera of the day. With F/3.5 Zeiss Tessar lens, £22 10 0.

# 'PANATOMIC' FILM ★

**S**UPERFINE Grain that allows big, rich enlargements; two sensitive coatings alive to every subtlety of light and shade; fully panchromatic emulsion, faithful recorder of colour values—these are some of the reasons why you get such exceedingly fine pictures on "Panatomic" Film.

**KODAK LIMITED, KINGSWAY, LONDON, W.C.2**

**Voigtlander  
BESSA**

**A** DETACHABLE mask in the back and the two red windows so that you can take 16 half-size pictures or 8  $2\frac{1}{2} \times 3\frac{1}{4}$  in. pictures on the same spool—a trigger-release fitted under the baseboard, enabling you to take the picture from eye-level without any risk of shakiness or vibration—these are just two of the unique features of the Voigtlander Bessa. With an air-equalisation system to prevent the film buckling, a special light-trapping system for panchro. films, the popular “three-point” focussing system, and a genuine Voigtlander anastigmat lens, the Bessa is remarkable value. Ask to see it at your dealers. It is a camera you should know about.

With f/7.7 Voigtlander Voigtar anas. lens in speeded shutter.. **52/6**  
Other models from £3 12s. 6d. to £8. 8s.

## CORRECT EXPOSURE EVERY TIME!

The New "AVO" PHOTO-ELECTRIC CELL METER ensures perfect exposures under all conditions.

How often have you wasted money on badly-exposed films?

Economise NOW and buy an "AVO"; you can't afford to be without one.

### EXCLUSIVE FEATURES:

1. Equally suitable for "Still" and Ciné Cameras.
2. Adjustment provided for plate and film speed.
3. Direct reading—no calculations whatever, no batteries.

### WHAT A CUSTOMER SAYS:

"Many thanks for prompt dispatch of the 'Avo' Meter. I have now tried this and am definitely keeping same. It is certainly superior to other meters costing considerably more. I enclose herewith cheque—having deducted the allowance quoted on my old meter, which, by the way, I consider very generous."

(Signed) Dr. ———."

(Original may be seen.)

See what your unwanted meter is worth. Let us make you a SUPER ALLOWANCE.

Only .....  
Yours for 22/- down and 8 similar monthly payments.

## HAVE YOU TRIED THE NEW VAUXHALL FILM?

### 9.5-mm. PRICES

2/3 per 30 feet, or inclusive of  
Processing Rights 4/-.

500 H. & D. Ortho Reversible

### WHAT "HOME MOVIES" SAYS:

"Vauxhall 9.5-mm. film is of excellent quality, with fine grain and good gradation, and quite apart from it being a good film it is sold at the very attractive price of 2s. 3d. for 30 ft., or, if purchased with processing rights, for 4s. There is thus a saving of 4d. and 7d. respectively for a 30-ft. reel."

—Extract from the test report published in the May issue, 1935.

### 16-mm. PRICES

6/6 per 50 feet, or inclusive of  
Processing Rights 9/6.  
12/- per 100 feet, or inclusive of  
Processing Rights 17/-.

650 H. & D. Ortho Reversible

## for Perfect Pictures

### SUPERCHROM

The very high speed and colour-sensitive Film with latitude that compensates for even serious errors of exposure. Use it particularly for very short exposures, speed subjects, poor lighting and interior work.

### GAYVERT (*Regular*)

For all ordinary summer and holiday snapshot work. Fast enough for all but the most difficult subjects and the worst of bad weather.

Both varieties in all usual sizes, and G20, G6.20, and G27 for all cameras taking 12 or 16 exposures on ordinary 8-exp. spools.

**ILFORD LIMITED  
ILFORD • LONDON**

The Ilford Manual of Photography—first published forty-five years ago—has always been regarded as a most informative and authoritative publication.

The enlarged and up-to-date edition has been written by a staff of experts under the Editorship of Mr. George E. Brown, F.I.C., Hon. F.R.P.S., for thirty years [editor of the British Journal of Photography and the B.J. Almanac.

In its twenty-five chapters every branch of photographic work is covered, important and reliable formulæ are given; a feature appealing to every camera user is the section devoted to an analysis of possible defects in negatives with valuable information for their prevention and cure.

The Ilford Manual is illustrated with line drawings and photogravure plates, and costs 2/-.

*Summer and Open-Air Number*

### THE HOLIDAY SPIRIT FOR 1935.

This attractive photograph offers a good suggestion for the amateur photographer at the seaside. By adopting the same idea, a striking greeting card can be produced that will be appreciated later when the holidays have become a memory.

### EXPOSURES AND THE WEATHER

**T**HE weather forecasts we have been experimentally publishing during the last few weeks have aroused considerable interest among readers. It has been intriguing to compare the forecast, day by day, with the actual event.

That the two do not always coincide in any given locality is inevitable. No weather forecasts, even for short periods ahead, are, or can be, infallible. Our weather is much too capricious for that.

But the wise photographer rejoices in the infinite variety which these caprices produce, as the variety of resulting effects is reflected in his pictures. No one can charge British weather with being monotonous. It is not a serious matter if grey skies are foretold, and we find that where we happen to be the sky is a deep blue against which bright cumulus clouds shine out. Fortunately, we can make pictures either with skies of grey or of blue and gold.

There is one thing of which the beginner must beware, and that is over-shortening his exposures when the day is bright and sunny. The stronger the contrasts of light and shade the more important it is for him to "remember the shadows." Whether the weather be bright or dull he must aim at suitable tones and gradations. And whatever the weather, and however it may or may not agree with the forecast, he may be assured that there is work for him and his camera.

### A WEATHER FORECAST FOR THE WEEK.

By D. K. BARTLETT.

#### THURSDAY, JULY 25th.

One of the main features of the day's weather will be the tendency to mist or fog, particularly in the South-West of England. Some of the best conditions for photographic work will be in the Eastern half of England.

#### FRIDAY, JULY 26th.

Breezy intervals will tend to clear the atmosphere in those areas where haze and mist have been interfering with pictorial work. Occasional drizzle in the West locally should not spoil the day.

#### SATURDAY, JULY 27th.

Some bright and clear periods should be general during the day. The cooler temperatures towards the Eastern Counties will be in favour of photographic work in spite of some thundery weather in the West of England and Wales.

#### SUNDAY, JULY 28th.

The weather will now change again to warmer conditions and some fine weather, but a definite thunderstorm tendency will be noticeable in certain areas, the Eastern Counties towards the South being one centre.

#### MONDAY, JULY 29th.

Some bright and warm weather gradually spreading into Western Counties of England and Wales. Thunderstorms are likely to occur in the East and South-West of England. Scotland should be well favoured for weather.

#### TUESDAY, JULY 30th.

Some thundery and doubtful changes may interfere with outdoor work at first, but it will break out bright and mainly fine later, although thundery weather may remain in the South-East slightly and in the South-West. Scotland should remain good for outdoor work.

#### WEDNESDAY, JULY 31st.

Remaining warm and fairly bright. Some local clouds and dull skies at times will not come to anything, and will clear to good weather for photographic work.

# "OPEN-AIR MINDEDNESS"

During the last few years the people of the British Isles, in common with those of most of Europe, have gone all "open-air," and the photographer has been well to the fore in this direction; indeed, many people have become photographers because of this call of the open. Different aspects of the open-air life call for different methods on the part of the photographer, and a few are dealt with here.

**W**HILE it cannot be said that each individual aspect of outdoor recreation sets a new problem, certainly most of them have small details which, if attended to, may make the worker's efforts infinitely more successful, both as regards pictorial photographs and also as jolly records.

## *The Hiker.*

The man on the walking-tour usually carries his belongings about from place to place with him on his back. His first consideration will, therefore, be one of weight of apparatus.

Obviously, he does not require a heavy quarter-plate reflex. The miniature camera solves his problem rapidly and effectively. One of the tiny twin-lens reflex type is ideal. It can be slung round the neck in its case, or even without, and is ready for instant action, because, of course, the hiker will see many more "bits" to take than his faster-moving brethren, and his camera, more than anyone's, needs to be always ready.

With these cameras films are used, therefore his sensitive material will take up little room and add but small weight to his pack.

The folding pocket type of camera is also very suitable, especially if it be one of the self-erecting type, and this also should be carried in its case slung over the shoulder. The most important point for the hiker is not to enclose his camera in his rucksack. It may be only a minute's work to undo this and remove the camera, but a lot happens in a minute in the pictorial world. The opportunity may be lost for a picture, and there is always the "bother" of getting the camera out.

## *The Cyclist.*

The cyclist is not restricted so much as his walking brother with regard to the weight of his camera, though he certainly does not need to carry a bulky instrument.

He can suspend his instrument from the frame of his machine, though it is much better to have a special case made for this purpose. It is quite easy to get a harness-maker to make a special case to carry the camera in, and this should not only be lined, but also should have some kind of shock-absorbent padding at the bottom in order to alleviate the jarring when negotiating roads containing "pot-holes."

The folding, pocket type, or the miniature proper, seems to be the best type of instrument, since it packs flatter than the smaller reflex type. The cyclist can also carry a light tripod, for which special clips can be obtained to facilitate its attachment to the frame of the machine.

There is little need for either hiker or cyclist getting stereotyped pictures of the picture-postcard type, since both have ample opportunities for getting off the beaten track, and it must be remembered that quite small sections of farmlands, leafy lanes, and wayside ponds often make beautiful subjects, providing too much detail is not crowded into the picture.

## *The Motorist.*

The modern motor car, while not being over-provided with room, usually has enough space after the party has been packed in to take any camera the driver may fancy.

The old whole-plate and larger instruments of our fathers' days are not carried now, so that it is hardly likely that the motorist will

want to carry anything larger than a quarter-plate reflex. This is, without doubt, a splendid instrument for the serious worker, especially as, being able to afford a car, one can naturally afford the rather high prices charged for film packs nowadays.

A word of caution may be added here, and that is to see that the film-pack adapter is correctly in register before the holiday trip is commenced. "Fuzzy" pictures may be considered artistic in some circles, but this kind of "fuzzy" picture will not be.

It must not be forgotten that it is possible to take photographs from a moving car, though this is a difficult procedure with a reflex. But with cameras like the Leica, Contax, etc., it is a fairly simple matter, and the fact that the bonnet of the car shows in the picture is not nearly such a drawback as would at first appear.

One other word of warning. When carrying miniature cameras, do not leave them about in the car unattended; they are valuable things, and so easily carried that it is not worth the risk of suffering loss to leave them behind. This, of course, applies to any camera; but the miniature is much more easily purloined than its larger relations.

The motorist will have the grandeur of the hills and valleys, and the sweep of the coastline for his subjects, or splendid opportunities for architectural studies, and quite a good scheme is to devise a tour taking in architectural examples, such as cathedrals, or, alternatively, hills and valleys, thus providing the photographer with a definite object for his tour besides just holiday-making.

### The Motor Cyclist.

The rider of the motor cycle has much the same problems as the cyclist. It is quite customary to suspend the camera across the shoulders, but is not a practice to be recommended. A leather case suspended on the side of the carrier, suitably padded, will keep the camera free from harm. Quite a good plan is to get two or three fairly stout springs and fasten them to a strip of wood that will fit in the bottom of the case; this is inserted with the springs towards the bottom, a layer of rubber sponge is placed on the top of it, and the case cover is fastened down firmly on top of the camera, making it practically free from any violent buffeting.

Subjects will be much the same as the motorist's, with a few additions wherein he has been able to reach a position inaccessible to the owner of the larger vehicle.

### Boating and Camping.

These two pastimes are often combined, and the equipment is

the same. Ordinary folding pocket cameras are very useful, and expedition in use is one of their main essentials. So many odd incidents occur on these outings which need to be snapped up quickly that the camera must ever be at the "ready." Human interest snaps are prolific with camping and boating expeditions, and the newspapers are always on the look-out for photographs of unusual incidents.

Extra care is needed with the instrument that it is not unduly exposed to damp or left lying about in the boat or in tents, always remembering that clumsy people may easily ruin a valuable instrument if they do not know it is left about.

### General Notes.

One of the most important things for all outdoor photographers is to know their instrument before carting it about the country-side. Nothing is more disappointing than to carry a camera about and then to find the exposures useless when they are developed.

Adequate cases should be provided always, and on no account should instruments be carried loose in jacket pockets, saddle-bags or car-pockets. Dust and dirt will soon ruin them.

Sensitive materials, especially films, are so easily obtainable in this country that it is really quite unnecessary to carry large stocks of materials; it is, however, better to have too much than too little, as it nearly always happens that the best exposure of the day crops up when all the materials are used.

The cyclist and hiker would be well advised to send their films home from time to time, and also the camper. Films can easily get spoilt packed in with clothes, slabs of chocolate, or left about to get wet in boat or tent.

Better results will be obtained by all outdoor workers if they decide to make a sort of running commentary on their journeys, with an inclusion of the car, cycle, or fellow-travellers.

## CARRYING THE CAMERA

For holiday-makers, both those who cycle and those who "hike," the problem of carrying the camera is solved by the suggestion given in the following note.

appeal to many cycle-photographers, especially when time exposures in evening light are wanted. Once fitted it is always ready when wanted and is not an extra to be packed up and

THE method illustrated shows a simple and handy form of carrying the camera which suits, with no alteration, pedestrian or cyclist, and is so self-evident that it needs no explanation. Another advantage is that the camera leaves the cycle with the rider and returns with him, saving the constant unpacking and repacking, the irksomeness of which sometimes causes the camera to be left on the cycle, when it will then surely be wanted!

The "cyclepod" here illustrated should also

refixed to the cycle after use. It is very simple, consisting merely of a strip of flat steel bent to the form of a capital Z. The central arm is vertical, the top arm horizontal, while the bottom arm is at such an angle as is formed by the top of the centre handle-bar lug. Attached to the top arm by a short  $\frac{1}{4}$ -in. Whitworth bolt is a small ball-and-socket head, such as can be bought from any dealer. The whole is fixed to the cycle by the long column bolt which is used to hold the handlebars to the frame, this bolt being passed through a hole drilled in the lower arm.

Owing to the amount of movement allowed for in the ball-and-socket head, it is easy to get the camera level, no matter at what angle the cycle has to be propped up.

# Sunshine and Shadow

By  
MAURICE WYRILL.

*Contre-jour.*

PICTURES representing sunshine and shadow effects have an attraction for most photographers.

Choose for preference the early morning or late afternoon, for it is then that the low sun sends long attractive shadows across the foreground and lights up everything in the path of its rays with a halo of radiance that transfigures even commonplace subjects.

Be on the look-out for shadow patterns, such as those thrown by railings, venetian blinds, or even a tennis racket.

Some of the best sunshine and shadow effects are obtained against the light in what photographers call *contre-jour* subjects. For this, the first indispensable acces-

*The Fountain.*

*A Sunshine Crossing.*

sory is a lens hood. A dull-black cardboard tube to fit over the lens-mount will do, but it is better to purchase one of the advertised specimens. In any case it should be tested.

If plates are used they should be backed. Use a plate or film of soft gradation, and preferably panchromatic, especially if there is a predominance of yellow light as when the sun is low. In these circumstances a filter is not essential.

With regard to exposure, remember the maxim "expose for the shadows." In *contre-jour* subjects do not be misled by the brilliance of the sun; remember that the shadow side is towards you and needs full exposure.

Development should be curtailed as for subjects of high contrast, say two-thirds of the normal time or less. The resulting negative will then be of such contrast that a "straight" enlargement on to bromide paper may be made without trouble.

July 24th, 1935

*A Cooler by the Way.*

IT is a long step since Cobbett wrote his "Rural Rides." How times have changed since then! Now, thanks to a wonderful railway and bus organisation, the photographer has abundant opportunities for spending a day in the country. "To one that hath been long in city pent"—this may be both pleasurable and prolific from a photographic standpoint.

Here is a ready means of seeking out charm in simplicity, a chance to record pictorially England's all too fast disappearing beauty. A pocket camera, a supply of films, possibly a small metal tripod and a packet of sandwiches (for the inner man

*"What shall it be?"*

as well as the camera requires "refilling") tucked away in a haversack, a stout pair of shoes and a light heart complete our requirements, with one important exception, namely, a bright sunny day!

Approaching the chosen village, we commence our operations on the simple dwelling-houses of the inhabitants. We hope that the roofs of these buildings may be thatched, to give a more picturesque touch. A fairly generous exposure will be necessary, as it is well to remember to expose for the shadows as well as the lighter parts. The usual bane of such cottages is the ubiquitous "TEAS" board, but this can sometimes be "dodged" by a tree-hole or by changing the angle of the viewpoint. Yes—"dodge" the tea-board, but enjoy the tea when films are "shot out."

# *A Day in the*

By E. E. ELCOMBE.

But no; reserve a few of these films for early evening, when shadows are long. For such evening work, when the sunlight tends to grow yellowish, an extra roll of panchromatic film will be a great boon.

Even though you may be a strict teetotaler, do not disdain the "village pub," especially if it be at all ancient. It is an English institution, and some of the older inns

*At Bromfield.*

*The Village Church.*

and their courtyards are full of possibilities for pictorial composition; there is always a fascination about them that smacks of stage-coaches and highwaymen. There is a utilitarian aspect also, for mine host is invariably well steeped in local lore, a veritable and useful "guide-book" to the wanderer.

The village church will demand inspection, and here the amateur photographer will gain much from the previous perusal of a book on the elements of architecture, such as Reed's "A Book on Architecture," published by Black (1s. 6d.), for then he will see with the "seeing eye." For

# Country

## Summer Photography amid Rural Surroundings.

this photography the light tripod will be wanted, as time exposures will be necessary; it is here that it will repay for the weight it adds to the haversack. Bear in mind that exposures should be on the full side rather than

*Changing Pastures.*

too short, and an exposure meter will be a great help in calculating the correct exposure required.

In the midst of the village photography do not neglect the village folk, especially the children. As a rule they are less sophisticated and more friendly than are town folk; each seems to know all. It frequently so happens that good groupings of children in spontaneous play may be photographed, giving prints that are full of human interest. In this work, speed up the shutter for movement in the subject, and open the lens aperture in order to obtain adequate exposure. There is a certain amount of mild rural activity in the early evening, for it is milking-time. Cows are being driven to the milking-sheds; milk is being fetched by old and young. Now is the time for action, and a number of films may be expended profitably.

*Across the Water-splash.*

In conclusion, let us add two notes in the nature of warnings. First, observe ordinary courtesy, and refrain from entering private property without taking steps to gain permission, even though it be from a humble farm-labourer's wife. Here a smile and a cheery word will work wonders and frequently act as an "Open Sesame" to photographic good things. Secondly, if you promise to send copies of prints, and one is almost always bound to do so on expeditions of this kind, *be sure and keep your promise*. In this way you will help to prepare the way for your second visit, also for those of your many brothers in the vast freemasonry of amateur photography.

*The Old Manor Gateway.*

# Picture Points

## for Beginners by RICARDO

### A Question of Balance.

ONLY a few seconds' comparison of these two seascape pictures is needed to decide which one is out of "balance," as it is termed. In the same way that we can say of two weights, held one in each hand, which is the heavier, so can we mentally weigh up the balance of a picture.

While every square inch of the print must play a part, it is the major masses of either light or dark tones that count first. The first question that arises is "on what point in the picture shall all those tones be balanced?" Very seldom is it the mechanical centre, the intersecting point

of the two diagonals, but is somewhere above or below this print centre on the same vertical line. As to how far above or below depends entirely on the subject matter.

In the picture below this tone centre is about three-quarters of an inch up from the bottom edge of the print. Now place this point on the other sketch on the left and it is obvious how the "tone-weight" of the picture is far too heavy on the left.

This sense of balance can easily be cultivated if practised constantly. The *motif* of the picture and the details of the different items should not be allowed to interfere when judging, and the best way to get rid of them is to half-close the eyes. One is then free to assess the tone weight of the masses only, making them easier to balance.

### "Against-the-Light" Pictures.

ALWAYS popular in summer-time snaps, "against-the-light" or *contre-jour* pictures provide a pleasant change from the usual variety where the sun is more or less behind the camera.

But several things have to be considered when making studies against the light. Pictorially speaking, the eye is usually attracted by the high-lights, and this fact must be remembered when composing for the main point of interest.

It will be noticed that when the light is behind the subject the tone contrast of all the different planes is flattened out, and, while this is preferable to direct sunlight for portraiture, it can be rendered extremely uninteresting if the subject is shown like so much flat grey card. So a secondary source of lighting to reveal the modelling is necessary, and this is easy to make, since anything of a light colour, such as a newspaper, can be made to act as a reflector.

With portraiture, be careful not to put the subject in a direct line with sun and lens, as then an equal margin of lighting will be shown all round. Preferably a little to one side is better, as suggested by the portrait. Another example of this type of lighting is shown in the top sketch.

From the technical side, the contrast of light and shadow makes exposure none too easy to calculate. The good old advice, "expose for the shadows and let the high-lights take care of themselves," applies to the majority of exposures, but not all, and the exceptions are subjects where the shadow portions are of secondary importance.

### Leading in to the Picture.

WHENEVER you have subjects that look or point, walk or ride, into the picture, be sure to allow them space in that direction. The two sketches here indicate this clearly.

In the sketch of the walker there is plenty of space in front of him, and this makes the picture easy to look at. If we reverse his position we have an uncomfortable feeling that he will be out of the picture any minute, making the composition unstable and unbalanced.

In the sea-gull sketch on the left the principle is again applied. Curiously enough, this space left in front of the direction adds considerably to the impression of the subject, and if it is a question of suggested movement, such as the two sketches show, the faster the movement the more space should we leave in front of them. It need not be always arrested movement, but anything that points or appears to point; a person pointing or looking, a signpost, the point of a pencil or pen, in fact anything that is associated with direction. This is also shown by the figure at the top of this page, which, although only a back view, still requires space for "leading-in."

# The WISE HOLIDAY-MAKER CHOOSES

## Rolleicord

### THE BEST OF THE POPULAR PRICED TWIN-LENS REFLEXES

... because it combines the advantages of the finest roll-film and reflex cameras. It shows you your picture full size and right way up on the ground-glass screen. You see it as large and clear as the finished print, and if it's not right you can reject it BEFORE you waste the film on it. You can't do this with ordinary cameras. Rolleicord is the easiest manipulated camera you could wish to buy. The Compur shutter has only one lever for setting and releasing. Rolleicord pictures are large enough to appreciate without going to the expense of making enlargements, and you get a dozen of these perfect pictures on  $3\frac{1}{2} \times 2\frac{1}{4}$  8-exposure roll film for 1s.

ROLLEICORD WITH LEATHER-COVERED BODY AND ZEISS TRIOTAR F/3.8 LENS. Takes popular-size roll films, or can be adapted for plates (as illustrated)....£12 15 0

### YOURS for 29/9

And another eight similar monthly instalments.

ROLLEICORD is also available with f/4.5 Zeiss Triotar lens and one-lever Compur shutter. With metal-finished body. For roll films only, £10:10:0. Nine monthly payments of 24s. 6d.

**GENEROUS ALLOWANCE ON YOUR ORDINARY CAMERA IN PART EXCHANGE FOR THE "ROLLEICORD."**

Send for free lists and fully illustrated literature.

# ACCESSORIES *FOR* CONTAX

ENABLING THE USER TO DO EVERYTHING POSSIBLE IN PHOTOGRAPHY

No. 1343.

## CONTAMETER

An ingenious optical appliance for taking close-ups. A distance meter with three interchangeable prisms and three supplementary lenses for close-ups at the following distances: 20 in., 12 in., 8 in. Price, complete, £10 5 0. Special Contameter booklet free on application.

## SPECIAL REPRODUCTION APPARATUS

For making negatives of small objects and reproductions in either natural size or weak reductions. Arrangement for varying sizes is by interchangeable masks and adapters. Price, complete, £6 5 0.

No. 5520/1.

## EQUIPMENT WITH MIKROPHOT

For using the Contax for photomicrography. Much interesting and important scientific work can be undertaken with the Contax used in connection with the microscope and the Mikrophot attachment. Further information on application.

## MAGNIPHOT ENLARGER

A vertical condenser enlarger for enlarging Contax negatives. The Zeiss lens from the Contax is used, and therefore perfectly defined enlargements are obtained. Enlarging ratio from 3 to 30×, or larger still if one uses the floor as an easel. Magniphot, with lamp, but without lens, £10 0 0.

No. 1455.

No. 540/13.

## CONTAX PLATE ADAPTER WITH FOCUSsing SCREEN

The Contax is the only miniature camera which will take a plate back, dark slides and focussing screen. Therefore single exposures can be made and developed immediately. Cost of plate adapter with one slide, £4 12 6. Extra Slides, 8s. 6d.; Ground-glass Screen, 9s. 0d.

## NEGATIVE VIEWER

This illuminating instrument is extremely useful for examining Contax or similar negatives.

The price of the viewer with illuminating housing is £5. Magnifiers from 14s. 6d. to £2 15s. Lamp, 15-watts, any standard voltage, 3s. 0d.

All the above, and many other Contax accessories, are fully described in our book "Accessories for Contax Photography," a copy of which will gladly be sent on application.

No. 1538.

**ZEISS IKON LTD.**  
11, MORTIMER HOUSE,  
MORTIMER ST., LONDON,  
W.1

# NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

**Reflex-Korelle.** A very neat and efficient reflex, taking twelve  $2\frac{1}{4} \times 2\frac{1}{4}$  exposures on  $3\frac{1}{4} \times 2\frac{1}{4}$  roll film, has just made its appearance. The dimensions when closed are  $5\frac{1}{4} \times 3\frac{1}{4} \times 3\frac{1}{4}$  in. The lens is used both for taking and for viewing, a focussing magnifier being incorporated with the hood. The focal-plane shutter is speeded from  $1/10$ th to  $1/1,000$ th sec. and bulb, the slow speeds being of particular value. The shutter itself is not arranged for time exposures, these being obtained by antinous release with fixing screw. Winding the film automatically sets the shutter, so that double exposures are impossible. The number of the exposure is mechanically

recorded as the film is wound, so that there is no need to use the red window at the back once the film is wound into first position. The trigger release is particularly well placed, so that a pressure movement, quite free from jerk, can effect the exposure. There is a frame finder for eye-level sighting and two small lugs accommodate a sling strap. Removal of the film is very simply effected, movement of a milled segment causing the pin holding the film to spring out. The lens has a focussing mount and is effective from 3 ft. to infinity.

The camera is well made and finished, and is a very attractive article. The cost with Schneider Radionar  $f/3.5$  is

£10 10s., or with  $f/2.9$ , £11 11s. The sole agents are R. A. Fleming & Co., Ltd., 32, Lord Street, Liverpool, who will be pleased to send full particulars to any reader mentioning *The Amateur Photographer*.

"The Miniature Camera Guide" should be of exceptional value and interest just now. It has been compiled with evident care and expert knowledge by William Alexander, and is published at 2s. 6d. (2s. 8d. by post) by The Fountain Press, 19, Cursitor Street, London, E.C.4. A special feature is Part II, which consists of 96 pages, each of which is designed to record complete details of a 36-exposure spool. The third section contains a mass of tabulated information on film speeds (Scheiner only), exposure tables for daylight and artificial light, development tables, filter factors, depth-of-focus tables, and so on. These brief particulars should be sufficient to indicate that the book is of exceptional value to miniature camera users.

**Lost.**—No. 2 Leica camera, No. 80987. To anyone giving information leading to recovery, a reward of £2 will be paid by Major Baldwin, Stoneleigh, Gloucester Road, Cheltenham.

We learn with regret of the death of Mr. Will R. Rose, at the age of sixty-three. After various professional and business experiences he set up for himself, in 1903, in a small shop in Chester. To-day the great D. & P. business, of which he has been the popular and successful head, has on its books the names of over 75,000 regular customers. Both in business and in private life Mr. Rose won golden opinions from all with whom he came in contact; he combined keen business instincts and ability with a kindly sympathy which endeared him to all who knew him.

A new and particularly inexpensive two-fold tripod for small hand cameras is now marketed by the Service Co., Ltd., 289, High Holborn, London, W.C.1. It is made of unstained wood, with an inset across the grain of the upper section of each leg to prevent warping. The bottom section slides into the upper with a smooth and effortless movement, being held in the desired position by a butterfly nut. The top is covered in green baize and has a fixed camera screw projecting an eighth of an inch. The length when closed is 29 in., extending to  $51\frac{1}{2}$  in., the price being 4s. 9d.

The President of the Professional Photographers' Association opened an exhibition of students' work at the Polytechnic School of Photography last week. There were sections devoted to portraiture, commercial and advertising work, architecture, flower studies and landscape photography. Each section was well supported, and the prints reflect the greatest credit, not only on the teaching that is given at the School for training photographers, but also on Mr L. J. Hibbert, the Principal.

Messrs. Ilford are to be congratulated on the production of a charming and attractive booklet which they have issued to commemorate the Silver Jubilee of Their Majesties. It contains a series of very fine illustrations in photogravure, all of which were made from negatives on Ilford Hypersensitive Pan. and Double X Press plates. They were taken in the first place by the camera-men attached to the various newspapers and agencies, and not only reach a high level of pictorial excellence, but are remarkable examples of fine technical work.

An Exhibition of Naval Photographs was opened by Rear-Admiral J. F. Somerville, on Thursday, July 18th, at the Ilford Galleries, 101, High Holborn, W.C.1. The pictures are by Mr. Charles E. Brown and are all of outstanding interest. The show remains open until August 10th and admission is free.

## Exhibitions and Competitions

CURRENT AND FUTURE.

Notices of forthcoming exhibitions and competitions will be included here every week if particulars are sent by the responsible organisers.

**The Amateur Photographer** Monthly Competitions for Beginners, Intermediate and Advanced Workers. Entries, July 31. Rules in the issue of June 26.

California Pacific International Exhibition, San Diego.—May 29–November 11. Particulars from Miss Ruth Kilbourne, Exhibition Headquarters, Balboa Park, San Diego, Cal., U.S.A.

Western Salon of Photography.—June 29–July 31. Hon. Salon Secretary, S. R. Lewin, 107, Shakespeare Avenue, Bath.

Lincoln Camera Club Annual Exhibition.—Open, July 5–28. Hon. Exhibition Secretary, J. H. Hutchinson, 44, Richmond Road, Lincoln.

Paris International Salon.—October 5–20. Secretary, M. E. Cousin, 51, Rue de Clichy, Paris.

Szeged (Hungary) International Salon.—August 4–21. Particulars from Magyar Amatortyenykepek Szovetsege, Csoportonak, Szeged, Hungary.

Southern Counties Salon (organised by Camberwell C.C.).—August 11–31. Hon. Salon Secretary, W. Bertram, 45, St. Lawrence Road, Brixton, S.W.

South African Salon (Johannesburg).—August 26–31.

Hon. Secretary, Johannesburg Photographic Society, P.O. Box 7024, Johannesburg, South Africa.

Amsterdam International Salon.—Entries, August 1; open, September 14–29. Further particulars from Focus, Ltd., Fotosalon, Bloemendaal, Holland.

London Salon of Photography.—Entries, September 4; open, September 14–October 12. Further particulars from Secretary, London Salon, 5a, Pall Mall East, S.W.1.

R.P.S. Annual Exhibition.—Entries, August 16; open, September 14–October 12. Further particulars from Secretary, 35, Russell Square, W.C.1.

Irish Salon (to be held at Mansion House, Dublin).—Entries, September 14; open, November 2–9. Particulars from Hon. Secretary, Irish Salon of Photography, 18, Morehampton Road, Dublin.

Rotherham P.S. International Exhibition.—Entry forms due, September 23; prints, September 30; open, October 16–19. Hon. Exhibition Secretary, E. George Alderman, Ruardean, Newton Street, Rotherham, Yorks.

Indian International Salon (promoted by Camera Pictorialists of Bombay).—Entries, October 1; open,

November 17–30. Hon. Salon Secretary, F. R. Ratnagar, Central Bank Building, Fort, Bombay, India.

G.W. Rly. "Camp Coach" Holiday Competition.—Prize, one week's holiday in camp coach during 1936 holiday season. Photographs should depict any aspect of camp coach holiday. Entries due, October 31. Further particulars from Superintendent of the Line, G.W.R., Paddington Station, W.2.

Canadian International Salon, National Gallery of Canada, Ottawa.—November 6–21, and afterwards in other Canadian cities. Entries due, September 20. Entry forms and further particulars from Exhibition Secretary, Canadian International Salon, National Gallery of Canada, Ottawa, Canada.

Cape of Good Hope International Salon (under the auspices of Cape Town P.S.).—Entries due, November 19; open, January, 1936. Hon. Salon Secretary, Richard Dekenah, P.O. Box 2431, Cape Town, South Africa.

Leicester P.S. International Exhibition.—Entries, January 24, 1936; open, February 24–March 7, 1936. Exhibition Secretary, H. Foscutt, 19, Doncaster Road, Leicester.

# Sea-Gulls

*A good seaside subject for a rapid shutter.*

By J. W. TICEHURST.

I WAS spending my summer holiday at St. Ives in Cornwall, where there are always a large number of sea-gulls in the harbour and on the foreshore. There is a little opening between the houses as you walk down the Warren and turn to the left towards the church, and it has become a common practice for visitors to bring scraps of food to feed the birds, which are very numerous at this spot.

I was told that this would be an excellent place to obtain photographs, and I arrived there one morning, and set up my camera, focussed it on the centre of the rock wall, with the harbour in the distance, and then proceeded to entice my subjects with small pieces of bread, but not one of them took the slightest notice.

The ice-cream seller, whose pitch is just to the left of the wall, was rather sympathetic towards my fruitless efforts, and he made a suggestion, which eventually proved entirely satisfactory. He told me that some of the sea-gulls had been there for so many years that they had long ago given up eating just plain bread, but they were very fond of a little butcher's meat; so I packed up my kit, determined to take his advice

*The Tug-of-War. Super-pan film. 1/500th sec., f/4.5.*

and have another try under more promising conditions on the following day.

Next day I proceeded to make friends with a local butcher, to whom I explained my mission. He was very interested, and informed me that bullock's windpipes were considered a great delicacy by the sea-gulls. In fact, it was almost possible to make them sit up and beg for them.

I hastened back to my pitch of the previous morning, full of enthusiasm, and the ice-cream vendor was delighted when I showed my purchase.

Some carefully selected pieces were laid on the wall, at the spot which I had in focus, and it was not very long before some of the birds commenced to circle round within a few feet, and eventually two or three settled on the wall and ravenously snatched up the food provided.

I immediately pressed the button—but, alas! I had forgotten to take out the slide from the film-pack holder, and by the time I had done this, and reset the shutter, the birds had flown away, and all the bait had gone.

However, I did not give up hope, and as the weather was fine, it did not take me long to obtain some more ammunition from my friend the butcher, which enabled me to secure some excellent photographs, one of which is the picture illustrated above, entitled "The Tug-of-War."

I do not know if any of my readers have ever been lost for subjects when out with their cameras, but I can assure them that if there are any sea-gulls in the neighbourhood they will find them very interesting and fascinating subjects.

My advice to amateurs is to use very fast material, a large aperture, and a shutter speed of 1/200th second or less. My camera is a Zeiss production throughout, with focal-plane shutter, and I think fairly accurate, but I have been amazed to see how quickly the wings of a sea-gull move, especially the tips. In view of this, it is not easy with close-ups to avoid all traces of movement on the negative, and at the same time retain depth of focus.

# Looking Down at the Seaside

By D. SWAINE.

IN exhibition and competition photography, the high viewpoint is no longer the novelty it was a few years ago, but, generally speaking, the average amateur does not exploit this angle a great deal.

With the coming of the summer seaside holiday a suitable opportunity occurs for quite natural experiments in this direction. In the popular holiday resorts—apart from Fenland—the holiday-maker in the course of his wanderings will look down from the cliffs over sea and harbour, from the pier and prom. on to the beach, and from such vantage points as hotel balcony, steamer decks and quayside.

Seaside photographs taken from well above the water level introduce one or two little problems which require some consideration, although not serious. That of parallel vertical lines is, fortunately, not one of the difficulties, as these are rarely encountered.

With these looking-down compositions it is somewhat difficult to convey an impression of depth and distance, therefore it becomes necessary to include figures or a boat, preferably in the middle distance so that comparison with the main subject matter is easy and natural.

Apart from a very near foreground interest tending to dwarf the view, it will be found that trouble will arise with the focussing. For instance, only a miniature camera would enable a sharp photograph to be made where photographer

*The End of the Pier.*

and model were on the same cliff edge, and the shore, hundreds of feet below, was an essential part of the arrangement.

As regards lighting, it will be readily understood that midday sunshine will give the worst possible effect, especially where figures play an important part. Foreshortened figures, with practically no shadows, seem so unreal as merely to excite a feeling of curiosity and amusement. But pictures from a high viewpoint taken against the light can interpret very attractive effects, and when the subject is in itself attractive, as so often happens at the seaside, the result will be very satisfying indeed.

One great advantage of this type of photography is that where figures or boats are concerned they may so easily be viewed against a plain background of water. When one recollects the distraction of people moving across the picture when snapshotting on the beach this is something for which to be thankful. But the water should be fairly calm ;

breaking waves can easily fling their foam in just the wrong place, thereby causing a high-light where it is not wanted.

When pointing a camera towards a large reflecting sheet of water it is advisable to fit a lens hood, even if the stop being used is not very large. It cannot do any harm, and might easily save a negative from having a bad flare-mark across. Such marks are always difficult to retouch when they appear on sea or sky. This reflecting power of the water and sky together also operates to lighten shadows, so that it is necessary to increase the development time.

Where it is the intention to build a picture around one main object which is being viewed from above, particular care should be taken with the placing of this in the picture space, for it will often be found that there is less assistance from the lighting than is the case when one's subject is seen from the same level as the camera. For instance, a person's face would normally reflect a fair amount of sunshine, but from above, hardly any face would be visible at all.

*Bournemouth.*

*Waiting for the Wave.*

*Up in the Clouds.*

WHO can dispute the popularity of sea-bathing as a holiday pastime, and what modern girl would think of staying a week or fortnight at the seaside without spending some of the time in the sea, and probably a good deal of time sunbathing. Sea-bathing is still highly popular, but to-day sunbathing ranks even higher as a popular holiday pastime.

There is no need to tell the amateur snapshotter that here is his chance for attractive camera subjects, for only last summer one newspaper which ran a "Bathing Beauty"

*A Study in Lighting.*

# The BATHING

An attractive and topical subject for the camera.

snapshot competition received over fifty thousand entries. But, unfortunately, of the "bathing girl" snapshots taken, a large proportion would never win a prize in any competition, so a few hints to the beginner may help him to get better results this season, whether his object is to enter competitions or merely to obtain pleasing pictures for his holiday album.

For the purpose of "bathing beauty" competitions it is essential that the figure should stand out clearly from the background, which should be as simple as possible, so as not to compete in interest with the figure. A plain sky background is about the simplest. This can be obtained by posing the subject on a rock and taking the snap from a

*A Seashore Colossus.*

low viewpoint, but not so low that the camera has to be greatly tilted up to get all the figure in, or distortion will show. A little more distant viewpoint will overcome this.

A more pictorial result can be obtained by using clouds as a background. If a panchromatic or even a fast 'chrome film is used, and a pale yellow filter placed over the lens, there should be no difficulty in recording the clouds. The user of panchromatic film will do well to keep a  $1\frac{1}{2}$ -times filter permanently on the lens during the summer months, thus enabling him to reap the full benefit of this useful negative material.

An excellent background for a figure in a light-coloured bathing costume is the opening of a cave, or rocks in shadow, with the subject herself in the sunlight. Using such back-

# ING GIRL

By  
E. RONALD SLEEP.

grounds as these the amateur photographer should get some attractive pictures of attractive subjects, for only Mrs. Grundy will deny that a healthy and happy holiday girl in a modern bathing costume is a very attractive subject for the camera.

Judging by some of the results seen, many snapshotters fail to realise how

*On Graceful Wing.*

*A Place in the Sun.*

the background can make or mar the picture. How often we see a photograph of a charming "bathing girl" on a beach with hundreds of other people in the background, plus a portion of the pier, and perhaps an advertisement poster for someone's whisky dominating (presumably unintentionally) the photograph. Some owners of rapid lenses think they can overcome the objection of such a background by using the full aperture of the lens, getting only the figure sharp and the rest out of focus. But such a detailed background can be even more objectionable "out of focus" than when sharply rendered, the "blotchy" appearance being most distracting.

If a lens-shade is available, and the wise photographer should always use one, striking effects can be secured with the sun to one side and slightly in front of the camera, lighting up one side of the figure, and if a dark background is chosen the result will be still more effective.

Besides these more or less posed subjects many other kinds of bathing pictures will suggest themselves. Snaps at the edge of the water with the surf rolling in, others of bathers on "floats" snapped from a boat, action snaps, leapfrog on the sands, all can provide jolly pictures full of the holiday spirit, and potential money-makers in "happy snapshot" competitions.

Little need be said of the technical side of this work (if such a pleasant pastime can be called work). The abundance of light available near the sea gives the owner of the simplest camera a chance to produce pictures which should provide an interesting addition to the holiday album.

*Beauty Afloat.*

# A Breezy Subject

## FOR THE HAND CAMERA

**N**O matter whether the hand camera is a simple "roll film," the most expensive miniature, or a cheap boxform instrument, the photography of yachts and sailing-boats at sea in the summer-time reduces them all to a common level. The exposure problem is practically non-

The lee side of a yacht in a good breeze showing the deck and crew always makes a better picture than showing the yacht heeling over in the other direction. Taken on pan. film, no filter, 1/100th sec., f/11.

The start of a race. Yachts jockeying for position and waiting for the gun. Pan. film, 1/100th sec., f/11.

Shots taken from the deck of another yacht provide opportunities for including useful foregrounds. Ortho. plate, 1/100th sec., f/11.

in some cases from the shore itself. Watch the lighting for sunlit sails against cloudy skies, and keep a low viewpoint.

The effect of speed is best suggested when two or more yachts are shown on the same tack, and racing in fairly close proximity, as above. Taken on pan. film, no filter, exposure 1/150th sec., f/8.

existent; the only thing that matters is choice of subject and a suitable viewpoint, entirely personal matters.

The largest aperture lens must be stopped down to f/11 or f/8, and the shutter exposure is always in the region of 1/100th second or less, even with a filter, if pan. films are used. For the best results the photographer should be on the water in a motor-boat capable of following a race, but good yachting pictures can also be secured from a pier head, and

A two-reef breeze. A less effective idea of speed is conveyed when yachts are shown coming towards the camera. Pan. film, x3 filter, 1/100th sec., f/8.

# PICTURES by Novices

## SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page

THE two little figures in No. 3 of the prints reproduced on the opposite page—"Great Fun," by Noel Pearson—are nicely caught and form an excellent group, but the reason for placing them so much in the corner and away from what is considered the right place for the centre of interest is obscure, and, as far as the remainder of the print discloses, without real justification.

### Rules and Regulations.

They should be more "in" the picture. The rules of composition indicate that, in a study of this kind, the most suitable place for the principal item or centre of interest is on or very near one of the four points of intersection formed by divisions of thirds. By this it is meant that if a picture be divided up into thirds, horizontally and vertically, the points where these divisions cross form positions which, on account of their strength, give force of placing to any item of significance that is allowed to fall on one or more of them or in their vicinity, assuming, of course, that the remainder are unoccupied by any element of equal importance.

Put in a simpler way, the principal item should not be allowed to be placed too near any of the edges, nor round about the centre of the print. A position near the edge is weak, and in the centre the impression is too formal for any but exceptional subjects.

The two children, in this example, make a natural centre of interest, but, because they are placed so near the edge, they do not acquire the importance they should in order to retain the attention. If they were put about three-quarters of an inch to the right the placing would be corrected and the compositional rule satisfied, but, unless there is more in the negative than appears in the print, the only thing to be done, now, is to trim the print on the right and base till something approaching the required proportions is obtained.

### Position and Placing.

Roughly, about one inch from the right and three-quarters of an inch from the bottom should be removed. This, unfortunately, while improving the placing, also has the effect of increasing the scale which the figures

bear in relation to the total picture space so that they would seem somewhat restricted.

The truth of the matter is, of course, that the placing should have been properly determined at the time the exposure was made, and, though a slavish adherence to rules is not advocated, it must be admitted that, had they been complied with, the appeal of the picture would have been very considerably increased.

The group around the boat in No. 2, "Sorting the Catch," by Alan T. Worth, is much better placed. The figures do not show the same contrast with the setting as in the former case, and, perhaps, do not stand out quite so well against it, but the subject as a whole seems better handled, and no alteration in position would be likely to offer any advantage.

### Simplicity of Arrangement.

The arrangement of the subject in relation to the boundaries of the print seems right, and, even after consideration, the impression that any alteration is desirable does not arise, whereas in the case of No. 3 it is almost apparent at a glance that the figures should be moved more towards the centre.

"Path of the Oar" (4), by E. Harrison, just misses being a good thing. Its idea, in a class devoted to the work of beginners, is unusual, and the combination of the well-placed boat and the attractive pattern in the water has highly pictorial attributes. The drawback is, however, that the figure in the boat is barely discernible. It ought to be decidedly prominent, so that, instead of the boat, the figure in it becomes the real centre of attraction.

As the subject stands there is a vague darkness against the dark of the boat. It is by no means clear that it is a figure, though it is obvious that oars cannot move of themselves, and, on this account, a query arises concerning the means by which the movement is imparted. Then, on a close scrutiny, the outline of the figure is made out, but such a scrutiny should not be necessary and it is unsatisfactory from the pictorial standpoint.

If the figure were standing it would be better, and, though it did not so

happen in this instance, it is possible that, on another occasion, fortune would prove more favourable. At all events, the composition has the virtue of simplicity, and, as such, is to be commended.

### The Usual Thing.

As far as arrangement is concerned, No. 5, "Sunlight on the River," by Albert Hill, does not offer any serious ground for criticism, but the subject matter—clouds and a boat seen against the light—is the sort of thing that everybody attempts at some time or other, and, in consequence, it seems rather hackneyed.

How many attempts of similar nature will be made during the present holiday season goodness only knows, and, in the majority of cases, they are only chosen because another photographer has obtained a rendering of clouds of some impressiveness for the first time, and, to the uninitiated, it offers an apparent added attraction over and above the usual blankness.

Try to get clouds in your pictures, by all means, but do not let them be of this facile and easily manufactured type. Rather make an endeavour to include them in your landscapes and sea studies so as to accord with the remainder of the subject and enhance it, somewhat after the way in which the gentle modulations of the sky in No. 6, "Breakers," by C. D. Cruickshank, blend with the greater interest of the seascape below.

### Subject and Treatment.

This is a simple subject simply treated, and, though it may be too quiet for some people's taste, it seems to exhibit a sounder attraction than the somewhat over-emphasised effect of its neighbour.

No. 1, "Hurlstone Point," by W. C. Crawley, shows a good wave at the point of breaking, and one that is exceedingly well caught. Here, it seems to be the case that the wave makes the picture rather than the point from which the picture takes its title. If this be agreed, and no doubt it will be, it might be possible to make a bit more of the wave by excluding some of the cliff. This could readily be done by trimming one inch from the right and about a quarter of an inch from the top. "MENTOR."

# With the Beginners

NOTES AND NOTIONS FOR THE  
LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

## SOME SUMMER SNAPSHOTS.

IT so happens that I have had very few opportunities of getting out with a camera this year, and I cannot produce any examples of my own of the sort of thing that can be obtained now that some real summer weather has at last arrived. (I refer to the weather as I write; by the time I am read, winter may have returned.)

Fig. 1.

I have therefore commandeered half a dozen prints by other beginners, and they are typical of some kinds of photographs now being produced in their thousands—or even millions.

I hope there are not too many thousands like Fig. 1. When I think of what can be seen on a summer day, even in the most sadly disfigured parts of the countryside, I cannot guess

Fig. 2.

at a reason for taking this subject, and still less for thinking it a possible prize picture. I can only look at the print with surprise; but if I saw the actual subject I should not photograph it, but should fly from it in terror.

The author of Fig. 2 was presented with promising, if familiar, material, and used it in a way which may be either right or wrong. For the purpose of pleasing the three people it is excellent; they would think it perfect. A competition judge would think differently. The close-up viewpoint has given unpleasant proportions; the horses should be straining to their task, instead of standing sleepily while their inferiors are having their portraits taken. The result is good as a personal record, but bad as a competition picture.

We all know the beauty of a track of light on moving waters, but this beauty is not easy to capture in a "still" photograph, and in any case some other interest is required to co-operate with it. Here there is nothing else; there is no fine sky above, and the two tiny boats at one edge are powerless for help.

In Fig. 4 there is again a track of reflected light, and a veiled sun. It suggests moonlight (suggests—not portrays); but even without the title, "Sunset on the Nile," we know it was a daylight shot. These are the days for "sunlight and shadow" effects, but let no beginner expect to do them justice who is under the impression that the said shadows are jet black. They are not. Even heavy cast shadows can be "seen into." The dense black masses in this print are false. I do not suggest that we must always stick to absolute truth and realism, but this picture would have been better if

Fig. 3.

its tones had been true to nature.

Successful sunlight and shadow pictures must have a due amount of detail and gradation in both light and shade, and these cannot possibly be secured by under-exposure and over-development. On the contrary, they result from an exposure full enough to register shadow detail, followed by development that is not carried far enough to produce over-density and "clogging" in the light parts of the subject.

Fig. 4.

Fig. 5.

Although, as has been so frequently pointed out, this is the correct procedure in the circumstances, it must be carried out with discretion. Otherwise we may avoid the rock of "soot-and-whitewash" only to flounder in the unpleasant swamp of "flatness." This is what has happened with Fig. 5. On that lily the sun was shining, as the shadows show. The

flower would be brilliant, but with soft, delicate gradations. Both brilliance and delicacy are, alas, lost; and even the clear-cut beauty of form has vanished because the flower is out of focus.

We must try very hard, in these bright days, before we can successfully secure in our prints the wonderful combination of brilliance and transparency which the magic of sunlight conjures up for us. Both the sunset and the lily fall short of the ideal. That is why I have shown them; not for the purpose of parading their shortcomings, but to teach us how easy it is to go wrong, and so to help to point us to the road that leads to success.

The original of Fig. 6 is a perfect print. Its tones are such as nothing but photography can give. Its author calls it "Dover Harbour," but it is nothing of the sort; it is a superb portrait of this particular ship. This is the sort of thing that we may all entertain some hope of achieving, not every time, but sometimes. In these

Fig. 6.

bright days we can find subjects in the country and the town, by the sea, here, there, and almost everywhere.

But however good and interesting some of these results may be, we should learn to distinguish between "records" and pictures. Of the prints here shown Fig. 6 is the only one that can pretend to competition standard, and even this has little to commend it beyond perfect quality. This is only one step towards picture-making; and now is our chance to put in plenty of practice, so that we can apply our skill to first-rate subjects when—at rather long intervals—we come across them.

W. L. F. W.

## Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

### A HOLIDAY FILM CAUTION.

SIR,—I should be glad if you can find space for the following warning which may prove of value to many readers of "The A.P." Take care not to fall a victim to the "film dodger." He generally has his shop near the sea front and the stall outside is piled high with the popular brands of roll films. These are all new and genuine, and may be bought without the slightest fear. The snag lies in the "film dodger's" eagerness to oblige.

A purchaser comes along and buys a film. "Shall I put it in your camera for you?" queries the affable salesman. More often than not the unsuspecting holiday-maker, not wishing to be bothered with the job in the middle of the street, assents.

The "film dodger" picks up the camera and a film from the pile in front of him, and retires to a back room, ostensibly to insert the film out of the direct light. He returns with the job completed, and the customer goes away, but the film in his camera is not the one he bought.

The slick trader has a stock of out-of-date "dud" films in his rear premises, and inserts one of these. The purchaser has no means of knowing this until the film is developed, and is then more likely to put the result down to insufficient knowledge of photography than to the real cause.

It is not suggested, of course, that every obliging dealer acts in this way, but if you want to be sure of your film, put it in the camera yourself.—Yours, etc.,

ARNOLD PICKIN.

### AN ENLARGER PROBLEM.

SIR,—In reply to E. E. M.'s letter in the issue of July 10th, I have had the same enlarging problem myself.

My enlarger is of the type used with the camera itself, and is fitted with an Osram 100-watt grouped filament lamp and  $4\frac{1}{2}$ -in. condenser, with no diffusing screen. All is well with

the lens set at its full aperture of  $f/3.8$ , but when I stop it down to  $f/8$  or smaller the same curious pattern appears. It should be noted that in my case the diaphragm is placed between the two lens components.

I think the defect is caused by the spherical aberration produced by the simple twin-lens condenser, and magnified by the size of the lamp filament.

Hoping this will be of interest to E. E. M.—Yours, etc.,  
R. M. SMITH.

### "DEVELOPMENT—AND ALL THAT."

SIR,—This is a very informative page for the amateur who "does for himself."

May I draw attention to the developing formula known as the "Buffered Borax"? Here is the Ilford Fine-grain Developer:

Metol	..	..	..	..	..	20 grs.
Sodium sulphite (crystals)	..	..	..	..	..	4 oz.
Hydroquinone	..	..	..	..	..	50 grs.
Borax	..	..	..	..	..	20 grs.
Boric acid	..	..	..	..	..	125 grs.
Water to	..	..	..	..	..	20 fl. oz.

My own procedure is to make up 100 fluid ounces at a time, and this will last about six months, and develop at least fifty rolls of Leica film, returning the used developer to the bottle.

In this solution Ilford Leica panchromatic film takes six minutes at  $65^\circ$  Fahr. to develop to a gamma of 0.8, and such negatives are full of detail and give excellent enlargements of twenty times or more on semi-matt or Lustre bromide paper.

This bottle of 100 fluid oz. of developer costs about 2s.

Note that the Ilford hypersensitive film is double coated and takes a longer time to fix than the usual.

I have used the fine-grain developers mentioned and have found them excellent, being easy to prepare.

The acid acetic wipe is very necessary in those parts of the country where the water is hard from lime or chalk.

I cut up my film into short strips of three pictures and these easily go into a smooth envelope of postcard size.—Yours, etc.,

"MEDICUS."

# How I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCXCI.

Mr. EDWIN  
BROOMER.

From information communicated to our Special Representative.

" I HAVE always considered photography to be a means of expression with very pronounced attributes of its own, differing radically from those of the other graphic arts; and this consideration has, to a large extent, always influenced the making of my exhibition pictures. If the finished result belies its origin, I have myself no use for it.

" This does not mean that my pictures are all perfectly 'straight,' for it sometimes happens that the results can be improved by indirect methods, such as spotting, shading and the like. I presume the necessity for such treatment is due to my lack of knowledge and experience, and maybe, when I have grown older and possibly wiser, I shall be able to produce a mechanically perfect result every time; but I doubt it.

" This implies that good technique, from the making of the exposure to the mounting of the print, plays a large part

in the final result. I have endeavoured by constant practice and experiment to reduce the manipulative processes to a kind of second nature.

" Having disposed of the overbearing fascination of the processes themselves it only remains to find, or in some cases build up, the pictures. About this, I am afraid I cannot say very much, since I take anything which appeals to me and seems to hold possibilities of producing a pleasing or original photographic result. I pay no particular regard to the rules of composition, or perhaps I should say, no studied regard. If the subject looks right, then I take it; and if the resulting negative shows that too much has been included, I simply discard those portions not required.

" Most of my pictures have been taken with a  $3\frac{1}{2} \times 2\frac{1}{4}$  Zeiss Ikonta with f/4.5 Tessar and Compur shutter, using panchromatic roll film, with or without filter, according to the demands of the subject.

" The exposed films are developed in a tank, using time and temperature methods, and I aim at obtaining negatives of good gradation and suitable contrast for enlarging on chloro-bromide or medium bromide paper, using contrast or soft bromide, as the case may be, should a negative fall below or above the usual strength.

" The enlargements themselves are developed in normal M.Q. developer to finality, passed through two acidified fixing baths, and thoroughly washed and dried. If the resulting cold colour of the print does not harmonise with the subject I tone by the double sulphide method, and obtain any desired colour from brown-black to brown or sepia, by varying the time of immersion in the redevelopment bath. Any unwanted residual sulphide stain is later removed by a brief immersion in a dilute bath of iodine-cyanide reducer.

" 'The Ringbolt' was taken fairly early in the morning, after a heavy shower of rain. The sun burst through from behind a cloud, and the gleam of light on the wet quayside attracted my attention. I realised there was a picture in the bolt and the broken lines of the concrete leading up to it, and it was only a matter of seconds to capture the effect, which had vanished completely a few moments later when the sun was obscured again.

" The print called 'Glass Angel' was a built-up composition made specially for a competition of the Torbay Camera Society. It was intended as a photographic design composed of glass and water. The fish was a small glass model suspended by fine thread in a witch-bowl filled with water. A light (half-watt electric) was placed behind the bowl, and the arrangement photographed on an enlarged scale at night, without any other source of illumination.

" Finally, and in common with other contributors to this series, I have found that perusal of *The Amateur Photographer*, combined with active membership of the Torbay Camera Society, and several circulating portfolios, has proved very helpful, and is a constant stimulus to the production of better work."

(A further example of Mr. Broomer's work is reproduced on the opposite page.

# OUR ILLUSTRATIONS

Some Notes on the Pictures reproduced in this issue.

**S**IMPLY sustaining its title, "JOIE DE VIVRE," by R. G. LEWIS, is remarkable in the sense of action it conveys, and also for the striking arrangement of the relative tonal values of the figure and the sky against which it is shown.

From the latter arises an excellent impression of sunshine. Naturally, the representation of the figure is the main theme, but the sunshine lends it an added grace and beauty and, besides, helps to distinguish and isolate it from its setting. Moreover, it accentuates the modelling and confers a strength and vitality upon the tonal distinctions that can be attained by no other means.

So much is attributable to the choice of the conditions under which the subject was taken, but the suggestion of action, in the main, is to be ascribed to a very nice judgment in selecting the right moment for making the exposure. The feeling is that movement is imminent, and, in consequence, the impression of vitality and life is very strongly conveyed.

The choice of this particular moment, again, has enabled the figure to be shown with a decisive and clear outline and without any blurring of the image. Having regard to her proximity, and the fact that what motion there would be, would be across the field of view, this is something of an achievement.

It makes an excellent holiday study, and the sense of air and space, an essential concomitant in a subject of this nature, is finely suggested. These qualities are also features of "THE BAY," by WILLIAM T. OWEN, which is also characterised by a feeling of light and luminosity.

In a work in which the sky is excluded, the latter effect is by no means easy to convey. It is created, here, by the introduction of the dark notes of the figures at somewhat sparse intervals, and by the depth of tone at the top and bottom right-hand corners, which, by contrast with the light tone of the sands and water, seem to endow both with glowing brightness.

The figures, too, have the virtue of emphasising the fine sweeping curve of the bay, which, running from the base upwards to the right and then towards the left to the top, forms an unusual, but nevertheless most effective, basis on which the composition is constructed. The figure (1) may be regarded as forming the centre of interest, both from the point of view of proximity and position, but it is the way the curve has been utilised that makes the arrangement appear out of the ordinary run.

Like the former picture, it is the sort of thing that can be attempted during the holiday season, and, of a different order, but one which is also likely to offer itself during the same period, is the study of a yacht in full sail—"THE SPINNAKER," by F. J. MORTIMER. Here, no less than in the case of "Joie de Vivre," the suggestion

of movement is well conveyed, and the fine lines of the sails lend beauty to their shape. The impression of sunlight, again, is admirably expressed, and it owes its feeling partly to the play of light and shadow on the sails themselves and partly to the juxtaposition of their brighter sections against the subdued tone of the sky.

position of their brighter sections against the subdued tone of the sky.

The suggestion of transparency in the spinnaker is a most uncommon effect, and, though it may be sometimes observed, it is rare indeed that it is reproduced. It is an incidental, of course, and, in most cases, it is necessary to devote the attention solely to securing the vessel in the most favourable position and lighting. Minor—if attractive—features of this or similar nature have to go by the board in favour of such more important considerations, but, all the same, the additional embellishment afforded by its inclusion does, most emphatically, enhance the presentment.

The arrangement of the subject in the picture space, with a greater space in front of the boat than behind, tends to stress the feeling of motion. This is emphasised by the diagonal lines into which the composition falls; but, lest these should prove too assertive, the line of the horizon and that of the clouds form an opposition of quieter inclination, so that, while movement is realistically rendered, it is prevented from becoming unnecessarily violent.

The picture is a fine piece of work, and well sustains its author's reputation in a sphere that he has made particularly his own.

"SUMMER-TIME," by H. M. SWAN, is equally appropriate as an illustration of the same season, is of a totally different class. It is portraiture purely and simply. The time of the year is indicated by the sunshine, its effect through the diaphanous hat, by the gauzy collar, and, imaginatively, through the smiling expression which the model displays.

It is delightfully done, and the pattern of sunshine and shadow upon the face—handled in the way it is—confers a sense of originality upon the work which enhances its gaiety and vital character. Noteworthy, too, is the effect of the single catchlight. In the eye on the left-hand side there is none, but in the other it is pronounced. With the marked pattern in light and shade on the same side, the catchlight in question makes the right-hand side predominant, and so it dominates the expression.

The fact that only one half of the face is permitted to be influenced by the play of sunlight and shade seems to have the effect of heightening the suggestion of modelling. When the device has been previously adopted, the pattern has usually been displayed all over the features, and, in such cases, the roundness of form has either appeared unduly accentuated, or, curiously enough, seriously diminished. On the whole, the present example seems to show up favourably in comparison, and of its daintiness and charm there can be no doubt.

More unsophisticated, perhaps, but no less dainty and charming, is the nude study by FORMAN HANNA—"THE SHADOW ON THE SAND." It attracted considerable notice when it was shown at the London Salon of

Photography, and is not only striking as an almost perfect example of the nude out of doors, but also for its fine incorporation of a brilliant effect of sunshine.

Both from the artistic point of view, and in its workmanship, it attains a very high standard indeed. The graceful pose, the beauty of the figure, and the way its appeal is enhanced by the radiance of the sunshine with which it is outlined are æsthetic attributes, and, technically, the range of tones, their quality and richness, are evidential of that sureness and mastery that only come from long experience and knowledge. The two sides, artistic and technical, are mutually interdependent, for, without the first, the second has nothing to express, and, in the absence of the second, it is impossible to convey the former to its full extent.

As far as the composition is concerned, the figure (1) assumes pride of place as the chief centre of interest. Her significance is indicated by the attraction created by the placing of light against dark—the brightest light is contained within her outline, and in close proximity are the strongest darks—and by force of position. The pull of human interest also has a decided influence, and, in the absence of any other element of equivalent appeal, her supremacy is unquestionable.

In "EVENING SILHOUETTE," by P. H. RESS, the opposite device to that employed in Forman Hanna's picture is employed, the figure being shown in deep tones against a lighter setting. From the point of view of arrangement, the degree of concentration is no less effective, but it is problematical if the interest attaching to the figure is the same.

With the figure as a dark in a bright setting, it rather seems as though the surroundings are inclined to attract a greater share of the attention than when the reverse obtains, and the attraction so diverted from the figure must necessarily diminish its claim to correspond. The feeling of luminosity, which, in this instance, takes the place of sunshine as the subsidiary motive, arises from the light reflected from the water, whereas, in the former case, the sunshine was contained within the figure so that, while the two attractions were combined in the first case, they are, here, two separate entities.

That is not to say that the appeal of the latter, as a whole, compares unfavourably with that of the former, but the intention is rather to draw attention to the distinctions between the two methods of treatment. In other respects, the arrangement of the composition is comparable and on similar lines, except, of course, that in this case the figure happens to be facing the other way and is on the opposite side of the picture.

The placing is no less forceful, and there is, likewise, no question about the supremacy of the figure as the principal item and centre of interest,

but it could be wished that, in the immediate foreground, the contrasts of tone were not quite so insistent, for, placed as they are, they are inclined to draw the attention away from the figure. The matter could be corrected by one of the many forms of control—the application of oil pigment suggests itself as one of the most convenient—by means of which the general tone would be subdued, and, at the same time, the assertiveness of the lights reduced.

"MENTOR."

# IF IT'S DALLMEYER THEN IT'S THE BEST

12-in.  $f/4.5$  Telephoto Lens for Leica.  
Fit a real Telephoto Lens to your LEICA. Prices from **£6 6 0**

You can buy an EXAKTA Camera fitted with  $f/1.9$  Dallmeyer Super-Six Anastigmat, also a 6-in.  $f/5.6$  DALLON Telephoto Lens for use interchangeably with this novel instrument.

Prices from **£8 15 0**

The T-P. RUBYETTE is supplied with a 9-in.  $f/6.5$  POPULAR Telephoto Lens, interchangeable with the standard 4-in.  $f/4.5$  Dallmeyer Anastigmat Lens, at **£5 5 0** extra.

For those requiring a camera which will give professional results without any knowledge of photography, the Dallmeyer SNAPSHOT is the only camera available. Price **£3 3 0**

It is fitted with a 4-glass anastigmat, an unusual feature in a camera retailing under **£5**.

Although we have sold in Great Britain some 8,000 Photo-electric Exposure Meters since their introduction in November, 1933, there are still a number of photographers and cinematographers who have not purchased one and, therefore, are still getting incorrect exposure. It costs but **£4 4 0** to get the right exposure always, which cost is soon saved in spoiled films and disappointments.

If you are enthusiastic regarding Photography or Cinematography, you will appreciate a DALLMEYER TELEPHOTO Lens. Remember we were the pioneers and are still the largest manufacturers of Telephoto Lenses for all makes, types, and sizes of Photographic and Cinematograph cameras.

Read the new book published by Pitmans, on "TELEPHOTOGRAPHY." Post free **3/9**.

Every lens should have a Dallmeyer Colour Filter for obvious reasons. Dallmeyer Colour Filters are made to screw into the front of the lens. Being made of coloured optical glass, they do not fade or warp and spoil the definition. Prices from....**10s. 6d.**

Still the largest aperture roll-film camera made—the Pentac Roll-film provides that extra lens speed which enables photographs to be taken practically day or night. Price, fitted with  $f/2.9$  Dallmeyer PENTAC Anastigmat Lens .....**£15 15 0**

Or with a Dallmeyer DALMAC  $f/3.5$  Anastigmat **£12 12 0**

The name of VICTOR has been synonymous with DALLMEYER since the inception of 16-mm. cinematography. VICTOR Ciné Cameras are available from 21 gns. They incorporate more features than any ciné camera selling under **£60**. Can we send you illustrated particulars?

# GREAT 'DAILY HERALD' COMPETITION

# £2,500 FREE

## FOR A SNAPSHOT

## UNLIMITED £2 2s. CASH AWARDS DAILY

*Send in your Snaps To-Day!*

**L**OOK through your collection of snaps. You may find a picture among them that will win the £2,500 must-be-won prize in the "Daily Herald's" great **FREE Snapshot Competition.**

Remember, too, there are unlimited £2 2s. daily awards for all snaps published in the "Daily Herald." This Competition is open to all amateur photographers. **Every entry will be examined** and all entries are eligible for the big prize whether or not they have been awarded a £2 2s. special prize.

Enter snaps from your collection and then go out "snapping" with your camera. Wherever you go this Summer be sure to take your camera with you—whether you are at home in the garden, or on holiday by the sea, on the river or in the country, there are prize-winning pictures all around you. Give your camera a £2,500 job to do and "snap" them. Every batch of snaps you send in will increase your opportunity of carrying off prizes.

A special Free Entry Form for readers of "The Amateur Photographer" appears on the right. Make up your mind to use it to-day and take the first step to a **FREE** fortune of £2,500.

**Further Free Entry Forms which must be pasted on the back of each snap submitted appear every day in the "Daily Herald."**

### SIMPLE RULES.

- 1.—A prize of £2,500 will be paid to the sender of the best photograph received during the run of the competition.
- 2.—From the photographs received each day a selection will be made and a special award of £2 2s. will be paid to the sender of any photograph reproduced in the "Daily Herald." At the close of the competition **every photograph will be judged**, and every entry, whether reproduced in the "Daily Herald" or not, will be eligible for the £2,500 cash prize.
- 3.—All entries submitted must have been taken personally by the sender, who must be an amateur. Photographs need not have been developed and printed by the sender and may be either "snapshot" or "time" exposure. **Photographs entered in this competition must not have appeared in any other publication**, and the entrant must be the sole owner of the copyright of each photograph entered.
- 4.—Entries in this competition may be of any size and must be unmounted. Entries cannot in any circumstances be returned to senders, and no correspondence will be entered into or interviews granted.
- 5.—**There is no limit to the number of entries you may submit**, but no photograph may be submitted more than once. A Free Entry Form will be printed each day in the "Daily Herald" during the run of the competition, and each photograph submitted must have one of these Forms properly completed and pasted on the back.
- 6.—The copyright of any photograph published becomes the property of the "Daily Herald," and the payment of a prize or special award shall be regarded as a copyright fee.
- 7.—The decision of the Editor of the "Daily Herald" must be accepted as final and legally binding on any matter relating to this competition. Proof of posting will not be accepted as proof of delivery.
- 8.—Employees of the "Daily Herald" (1929), Ltd., and any associated companies and members of their families are not allowed to compete.
- 9.—Entries may be sent in at any time during the competition, and must be posted to "Snaps," The "Daily Herald," 4-6, Arne Street, London, W.C.2. The closing date of the competition will be announced later in the "Daily Herald."

### FREE ENTRY FORM FOR "THE AMATEUR PHOTOGRAPHER" READERS

Complete Entry Form below in Block Letters. Cut it out and paste it firmly on the back of your Photograph.

Entry Form "A.P."

# Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

## Humour in the Holiday Film By E. APPLEBY.

WHILE the projection of the holiday film will inevitably be of considerable interest to all those who have parts in it, its value will be greatly enhanced if it can be made to appeal to a more general audience, in such a way as to arouse approbation and not such polite "very good!" remarks which our more courteous friends bestow on these efforts.

Some universal medium must therefore be introduced into the scenario, and one of the most universal is, of course, the appeal to the sense of humour. The cinema has many opportunities for this, since humour that is suggested is often much more enjoyable than that which is obvious.

The holiday film makes a splendid base on which to build touches of humour, since it is in itself a light-hearted theme, and the audience should be very near to laughing most of the time.

One of the great advantages of these humorous touches is that members of the party taking part can be rehearsed, and will obtain much unexpected amusement from the enactment of them.

No holiday film is complete without the family pondering over various guides, and in many families the annual upheaval occurs at this time when each member of the family wishes to visit a different resort. Here is a touch of humour at the very commencement; members of the family can be shot studying various guides, care being taken that the place-names recorded on the pages shown are as far apart as possible, while one of the younger members of the family can be recorded studying a guide to the Zoo or the Museum, or anything equally ludicrous. An appropriate sub-title will make the suggestion complete.

Another shot that can be taken is the one of the lost tickets. The shot of the tickets on the sideboard, mantelshelf, or some other suitable place, can be taken at any time and incorporated in the film at editing. But it is as well to have father's frantic search at the station recorded at the actual time, when mother can co-operate and both can appear to be distracted. Quite a good wheeze is for father to have the tickets tucked in the band of his hat, and a close-up of him at home searching distractedly for them will add to the piquancy of the situation, particularly if he keeps his hat on. This is another shot that can be taken beforehand.

That very old gag about the "one-minute-from-the-sea" boarding-house can also be turned to quite good effect. A close-up of a specially-prepared advertisement can be taken, with the above description showing prominently, and then a medium shot of father leaning out of the topmost bedroom window—a close-up having already been taken of the legend on the gate—with a large telescope, and then a view of roofs and chimney-pots can follow to suggest his viewpoint.

An intelligent dog is a useful accessory also for this phase of the work, and an excellent slice of humour can be added by making the animal run off with father's trousers while he is in the bathing-tent. This is not very difficult to stage; first of all a shot of him coming up from the water, whistling merrily; he dives into the tent, the dog strays along, sees a portion of the trousers protruding just under the edge of the tent, and under the encouragement of someone out of sight of the camera is made to drag the trousers out, and run

off with them along the beach to someone waiting and calling, also out of sight: Father's tousled head, with an appropriate expression of horror, protrudes from the top of the tent, which he pulls tightly round his neck, and mother's arrival with a pair of shorts will finish this little section.

Deck chairs are awkward things to handle, and the most can be made of one of them turned inside out, with the united efforts of the party hindering one another in getting it just right, while when this has been accomplished it neatly collapses just as Sister Doris sinks into it gracefully.

At many places where they let out small boats opportunities for staging humorous incidents will occur with some frequency. On rocky coasts the efforts of amateur oarsmen to get their boats off these shallow sunken rocks are often ludicrous. Their attempts to steer one of these little craft will also provide opportunities for humorous shots. Gerald's artistic river rowing may be shown, and also the occasion when he disappears

Action subjects for the amateur cinematographer abound at the seaside at the present time. Surf-board riding taken from the stern of the boat that tows them will provide a particularly "lively" film.

over the back of the seat, having caught a "crab." If any member of the party is at all accomplished at facial expressions a great deal more effect can be added to these incidents, but camera-consciousness is the most important thing to avoid.

Fishing provides many humorous aspects, and the ubiquitous stone jar need not be left out of the picture; indeed, it should be well to the fore,

and the empty fish-kettle can be shown, with the fisherman purchasing a couple of fish from a small boy, or even from the fishmonger, and putting them into his kettle.

These are just suggestions, and the shots will, of course, not be part of the continuity of the actual holiday film. But if some little attention is given to details they can quite easily be fitted into the film when it comes up for

editing, and the skilful addition of a few titles will greatly enhance the whole ensemble. The humour should be suggested rather than baldly stated.

One final warning should be given. Care should be taken that nothing likely to give offence to those taking part is included, as if anyone is of a sensitive nature it is better that they should be omitted from the cast, and reserved for more solemn occasions.

## Crescendo! By R. H. ALDER.

**I**N music, beauty lies not in notes and chords, but in the interweaving of melodies or the rhythmic succession of harmonies. So far as there is an analogue in visual art it is in the cinema; there only do we find progression in space and time together which corresponds with simultaneous movement in pitch and time.

Out of an apparent welter of full orchestra the composer picks a thread of tune, embroiders it, develops it, tosses it from this instrument to that until we discover that it is charged with emotion otherwise inexpressible. It slips back into the sea of sound, another tune appears, filled with a different message, and is absorbed in turn.

*Tutti.*—The long shot is the cinematic equivalent of full orchestra. In it is a mass of thematic material, ideas apparently at variance with one another; weft and warp that are resolved into the web of life.

The difference between the professional and amateur scenarist lies in the fact that the former, like the composer, can choose the theme which each performer plays, the latter must accept the world as he finds it.

That does not mean that the amateur's selection is too limited. Here, for instance, are the opening shots of a holiday sequence. Fade in on a close shot of a strongly-lit lifebelt, prominently marked "Newquay U.D.C.," set against a dark background.

Dissolve to medium shot of the coast-guard station on the headland; pan. to

long shot of the looping coastline, surmounted by (filtered) sunlit cumulus clouds, in the foreground a mariner raises a telescope to his eye. Cut to telephoto shot of a section of the beach from the same viewpoint, showing groups of bathers.

*Allargando.*—Then follow shots on the beach: medium long of a particular group; close medium of one person in the group followed by very close shot to establish identity—and there we are back into the swing of our personal theme!

Effectually we have sections of an enormous tracking shot with a long long-shot at one end and a close close-up at the other. To have jumped from one to the other would have had the effect of suddenly stopping the orchestra and playing *sforzando* on one instrument—legitimate, perhaps, in contemporary music, but hardly in accord with classical tradition.

Not only in personal films but also in abstracts and documentaries the long shot has its place. It sets the scene and provides a useful continuity. We can open out from the market stall to the market square, from there to the Town Hall, and narrow down from that to the smallest of local relics without losing the attention of the audience for one frame.

*Cantabile.*—Some day a producing club will find in Sir Thomas Malory a rich mine of real story. This is an essay in the opening of "Geraint." Fade in on a long shot of castle silhouetted against the sky up left, right foreground

a knight riding towards it; cut in alternately close-ups of Geraint riding, and ever nearer shots of the castle.

Cut to the "shatter'd archway fringed with fern" through which Geraint rides. In a series of shots, starting medium long and closing up to "busts," is Yniol's welcome of the knight. The accompanying sound, in smooth counterpoint against this recurrent cutting, is a fading up of Enid's song "Turn, Fortune, turn thy wheel," and at the last stanza the screen shows Enid spinning.

Of all these shots only the longs and that of Geraint riding through the archway need be made on location. A reproduction of the inside of one column of the arch in the club's studio will serve to link exteriors with interiors, yet the audience will feel that all the action is beside the Severn.

The same film fades out on a series of longer and longer shots of the castle against a sunset sky, cut with close shots of Geraint and Enid riding happily to Caerlyon, reining in to look back...

*Coda.*—There will arise a Wagner to compose screen and orchestra together as the great Richard did with the stage. Music then will not "accompany" the picture; the two will be integral and indivisible.

Before that happens the amateur must show the box-office the way. At present Big Business appears intent on cutting "The Ring" to fit recognised programme time, like Procrustes amputating or stretching his captives to fit his standardised bed.

Who wants a broken vase?

## The Vauxhall Hyper-chromatic Ciné Film.

**T**HIS new reversal, non-flam film, recently placed on the market by The Camera Co., of 320, Vauxhall Bridge Road, London, S.W.1, will interest all ciné enthusiasts. It is available in the 9.5-mm. and 16-mm. sizes, and can be purchased with or without processing rights.

After an exposure test, a sample spool was processed by this firm, and, on examination, revealed some excellent qualities. It is remarkably fast for this type of film, its speed to daylight being

an actual 500 H. & D., and on all types of subjects, in dull and brilliant light, it revealed a good margin of latitude, a real asset for reversal stock, as all practical workers know.

Although it is a fast emulsion, the grain is quite as fine as that of the slower types, while the contrast and brilliancy are exceedingly good.

The non-flam base is clear and strong, and, after being projected many times, showed no buckling or trace of weakness round the notches.

The prices for 9.5-mm. are 2s. 3d., or 4s. inclusive of processing, per 30-ft. run; 16-mm. 6s. 6d., or 9s. 6d. inclusive of processing, per 50-ft. run; and 12s., or 17s. inclusive of processing, per 100-ft. run.

For those who prefer to process their own, full instructions and formulæ are available.

Altogether, the Vauxhall film is an excellent film that should prove to be popular, and encourage more ciné work amongst amateurs.

## THIS HOLIDAY PHOTOGRAPHER SAYS—

**"TRUST WESTON  
—TO GET IT RIGHT"**

## WHEN YOU GO ON HOLIDAY

to the coast, cruising or abroad you are taking photographs under conditions which are entirely strange to you. The light is different and difficult. Yet this is the time above all others when you want to be sure that every photograph you take is a success. You can only be certain by letting the Weston Exposure Meter measure the exposure for the scenes with scientific accuracy and certainty. This it does in an instant and tells you the correct shutter speed and lens aperture for every shot. Direct sunlight cannot damage it—its sensitivity and efficiency are permanent. Once you've bought your Weston you are certain of successful photographs always—there are no renewals—no cost of upkeep—Weston lasts a lifetime.

**PRICE REDUCTION.** The Weston Universal Exposure Meter, for "still" and ciné cameras, now only £6/15 cash, or on easy payments, 15/9 monthly.

## A Competition specially for Novices

### SUBJECTS.

Prizes will be awarded for the best snapshots of family groups or single figures taken at home or on holiday, indoors or outdoors. The arrangement of the groups or the pose of the figures is left entirely to the discretion of the competitor.

The competition is open only to novices: those who have never won an award of any description in a photographic competition.

Entries are restricted to contact prints. The smallness of the prints, which may be mounted if necessary, will not affect their careful consideration in this competition.

### PRIZES.

The prizes will consist of supplies of roll film or of plates (if any winner happens to use a plate camera).

THE FIRST PRIZE WILL BE TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.

THE SECOND PRIZE WILL BE TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.

THE THIRD PRIZE WILL BE ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.

TWELVE PRIZES OF ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

The winners of these prizes will thus be encouraged to continue their photographic activities throughout the year with a supply of free film.

### RULES.

Each print must have affixed firmly to the back, a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor. The latest date for receiving entries is September 7th, 1935. This will give new readers, who are novices, who intend entering this competition every opportunity of improving their work during the next two months by reading "The Amateur Photographer" every week and obtaining their competition prints during the summer holidays.

The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed as follows: The Editor, "The Amateur Photographer," Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices' Competition."

Further references to the competition will be made week by week, and hints given for the best treatment of groups and figures.

# Readers' Questions ANSWERED

**GENERAL.**—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

**CONTRIBUTIONS.**—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

**ENQUIRIES AND CRITICISM.**—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case of this rule except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

## Dull Negative.

Can you explain the grey dull appearance of the enclosed negative? E. R. (Rochester.)

We do not quite understand what you mean by the grey dull appearance of the negative, as, apart from slight stain, it is quite a good one. You are possibly not aware of the fact that Verichrome film has a matt surface and therefore does not have quite the clear, transparent appearance of other films.

## Liquid Safelight.

I am making a safelight of two glass globes with a lamp in the inner one. Will you give me a formula for a solution suitable for the loading of ordinary plates? E. H. (Willaston.)

Dissolve 2 oz. of potassium bichromate in 20 oz. of hot water, then add 1 gramme of Eosin. Stir thoroughly and allow to cool. You will almost certainly find a slight sediment. Decant the clear liquid, add three or four more ounces of water, and filter. The solution is then ready for use.

## Titles of Prints.

In the criticism of a print by "Mentor" to what extent is the percentage of good marks or the artistic aspect influenced by the aptness or inaptness of the title? L. H. J. (Acton.)

We find it difficult to give any definite answer to your question. We should say, in a general way, that the title does not influence the criticism, unless the title itself suggests some particular idea or aim of the photographer which has obviously not been achieved in the result. The title would then be inappropriate. Some of the best pictures do not need a title at all.

## Proportions in Developer.

The quantities given for amidol developer seem to differ considerably. What is the effect of having too much or too little sulphite or bromide? T. M. P. (Folkestone.)

There is considerable latitude in the proportions of amidol developer, and

if you adopt any one of the standard formulae there is no reason why you should have too much or too little of any one constituent. In our own practice we sometimes omit bromide altogether for bromide paper, and, as far as we can see, the omission does not lead to fog or any other trouble. The best plan with any given paper is to adopt the proportions given in the instructions.

## Paramidophenol.

I do not want a concentrated paramidophenol developer, but one to make up as required for use. Can you help me? C. E. P. (Caracao.)

Here is a formula which should suit you:

A.	Paramidophenol ..	200 grs.
	Potassium metabisulphite ..	100 grs.
	Distilled water to ..	20 oz.
B.	Sodium sulphite ..	1½ oz.
	Potassium carbonate ..	1½ oz.
	Distilled water to ..	20 oz.

For use take one part of A and two parts of B, mixing thoroughly.

## Temperature.

I have noticed in "The A.P." several references to temperature, and yet you don't mention it in the article on development and printing. Does it refer to the developing solution or the washing water? A. N. (Burton.)

We cannot quite understand your letter. When temperature is referred to it means the temperature of the developing solution, and is only of importance when negatives are developed for a certain time without inspection. It has no reference to the washing water.

## Smashed Lens.

I smashed the back element of a — lens, and a local workman who tried his hand at it has made matters worse. Can you tell me of a firm who will undertake to repair such a smash? C. McL. (Edinburgh.)

It is quite impossible to repair a smashed lens, and the only thing is to

replace it. As far as we are aware this particular lens is no longer on the market, and we cannot now trace the firm who used to manufacture it. You might communicate with the Premier Optical Co., Ltd., 63, Bolton Road, Stratford, London, E.15, who might be able to replace the broken element, but we think it likely that you will have to regard the lens as a loss.

## Drying Plates.

Can you tell me how to dry plates quickly after development? J. E. D. (Leeds.)

There are several ways of drying plates quickly, but it is not easy to condense the information. One method is to immerse them for a few minutes in two successive baths of methylated spirit, after which they dry very quickly. At the same time, this is likely to cause stains and other defects, as the spirit is not likely to be pure. Another method is to treat the plates with, say, a 5 per cent solution of formalin and surface-dry them, after which moderate heat can safely be used in drying them.

## Choice of Camera.

I have seen demonstrated the two ciné cameras of which I give a brief specification, but as there is much to be said in favour of each I cannot decide which to choose. Can you advise me? J. R. (London.)

The difficulty which you find in deciding which apparatus to select applies also to us. As you rightly say, there is something to be said for each of them; they are both good value for money, both the firms are reliable, and both the instruments give excellent results. We do not think that the choice between the two is a matter of any real importance.

## Permanence.

What kind of printing paper is likely to produce the most permanent results? How long should prints last if stored in an album? N. W. D. (Chertsey.)

Platinotype paper is possibly the most permanent printing process, as the image will last longer than the paper itself; but it is very expensive. Carbon paper, either in the original form or worked by the Carbro method, may also be regarded as permanent with most of the pigments used. Ordinary bromide and gaslight prints, if properly produced and kept under favourable conditions, should last a quarter or even half a century.

## Fogged Negative.

All my films show fog like the one enclosed; can you suggest the cause? E. W. (Pembroke.)

Your camera is evidently letting light leak in, and we can only suggest that you send it with the negatives to a firm of repairers, and ask them to locate and remedy the trouble.

## Filter Factor.

I have a yellow filter marked "Korelle mittel." What is its exposure factor? W. S. O. (Craigavad.)

You are apparently not a regular reader of the paper or you would have seen that we have frequently drawn attention to the fact that no light filter has one invariable factor. The factor varies considerably according to the emulsion with which the filter is being used, and must be found by trial.

# BUY YOUR CAMERA NOW BUY A ZEISS IKON

## BABY IKONTA

A compact miniature camera fitted with a variety of lenses and shutters, which can be thoroughly recommended for general amateur use. Takes 16 exposures  $1\frac{1}{2} \times 1\frac{1}{2}$  on usual V.P. film.

With Novar f/6.3 and 3-speed Dervall..... £3 12 6  
With Novar f/4.5 and 3-speed Dervall..... £4 5 0  
With Tessar f/4.5 and Normal Compur..... £8 5 0  
With Tessar f/3.5 and Rapid 1/500th sec. Compur £10 10 0

## IKONTA

The camera which is "ready in a jiffy." 100 per cent self-opening; 100 per cent good pictures. The  $2\frac{1}{2} \times 1\frac{1}{2}$  size takes 16 pictures on the usual  $3\frac{1}{2} \times 2\frac{1}{2}$  spool. The  $3\frac{1}{2} \times 2\frac{1}{2}$  and  $4\frac{1}{2} \times 2\frac{1}{2}$  sizes give either 8 exposures or 16 divided, and are fitted with the new Albadia finder.

$2\frac{1}{2} \times 1\frac{1}{2}$ , with Tessar f/2.5, Normal Compur shutter £10 15 0  
 $3\frac{1}{2} \times 2\frac{1}{2}$ , with Tessar f/4.5, Normal Compur shutter £11 5 0  
 $3\frac{1}{2} \times 2\frac{1}{2}$  New Model, with Tessar f/3.8 and Compur up to 1/400th sec..... £15 12 6  
 $4\frac{1}{2} \times 2\frac{1}{2}$ , with Zeiss Tessar f/4.5 and Normal Compur shutter ..... £13 0 0

## IKOFLEX

The new Zeiss Ikon camera, which shows you exactly the picture you are taking. Two anastigmatic lenses, one for taking, one for viewing. New type condenser, ground-glass screen giving brilliant pictures even to the corners, magnifier for viewing the picture; focussing and automatic film-winding lever. Takes 12 pictures on the usual  $3\frac{1}{2} \times 2\frac{1}{2}$  film.

Price, with Novar f/4.5, Dervall 3-speed shutter £7 15 0  
Klio, with "take-yourself" releasing action, 7 speeds..... £8 10 0  
Compur Rapid to 1/500th..... £10 2 6

## SUPER IKONTA

The highest-class distance meter coupled with lens roll-film camera that can be obtained. Zeiss Ikon precision work, Zeiss lenses, Compur shutters.

For 16 pictures  $2\frac{1}{2} \times 1\frac{1}{2}$  on  $2\frac{1}{2} \times 3\frac{1}{2}$  spool, Zeiss Tessar f/3.5..... £18 12 6  
 $3\frac{1}{2} \times 2\frac{1}{2}$  ( $2\frac{1}{2} \times 1\frac{1}{2}$  divided), with Tessar f/4.5.. £19 0 0  
 $4\frac{1}{2} \times 2\frac{1}{2}$  ( $2\frac{1}{2} \times 2\frac{1}{2}$  divided), with Tessar f/4.5 £19 15 0  
New Model,  $2\frac{1}{2} \times 2\frac{1}{2}$  (11 exposures on usual  $3\frac{1}{2} \times 2\frac{1}{2}$  film), with Tessar f/2.5..... £28 5 0  
The new Compur Rapid is supplied, except with  $4\frac{1}{2} \times 2\frac{1}{2}$ , which has the Normal Compur shutter.

## MOVIKON CINE CAMERA

The latest and most modern development of the 16-mm. cine camera. Distance meter coupled with lens focussing: "take yourself" release; automatic compensation for parallax, and a host of other improvements detailed in the Movikon brochure free on application. Price, with Sonnar f/1.4, £98 10 0

Interchangeable lenses and a wide range of accessories available.

### EXTRA LENSES:

2-in. 1/2.8 Sonnar £15 15 0

3-in. 1/4 Sonnar £23 12 6

Leather case for camera and lenses .. £4 15 0

## HELIOS ELECTRIC METER

A new Zeiss Ikon electric exposure meter, compact, light in weight, no calculations wanted. You set your film speed and an observation in the Helios does the rest. Price, in leather case, £4 17 6

## CAMERAS IN DAILY USE

*The reason for the Leica camera's unprecedented success is that it answers so completely every possible requirement of the photographer.*

Imagine the diversity of taste and interest of 150,000 people, and then realise that everyone is not only satisfied but enthusiastic about the Leica.

Numerous booklets deal with the full possibilities of photography with the Leica—any or all will be sent on request. Briefly, this is what the Leica will do:—Snapshots at night, indoors or out, without special lighting. Sport and speed subjects of all kinds. Architecture. Portraiture. (Leica negative will enlarge up to almost any size without trace of grain or fuzziness.) Landscape, with enormous depth of focus. For close-ups, copying and technical detail work, the Leica can be focussed down to 3 ft. Press photography—its instant readiness permits a series of pictures to be taken in a few seconds. Clinical work, natural history, etc.

MODEL II, with f/3.5 Elmar lens and 8 more monthly payments of 61/10 £26 10 0 cash.

LEICA MODEL III, with f/2 Summar lens on easy payments of 8 more monthly payments of 92/2 and £39 10 0 cash.

**New Leica Model IIIA, speeded to 1/1,000th, at £43, now in stock.**

**EVERY LEICA LENS and ACCESSORY always IN STOCK**

Special Leica News Binders (ask for particulars). We will load your Leica chargers with 12-exposure films, 1/3 each. Register your Leica for all Leica benefits.

**OUR LEICA EXPERIENCE IS UNEQUALLED—AND WITHOUT FEAR OF CHALLENGE WE CLAIM TO GIVE THE BEST LEICA SERVICE**

*The most generous allowances in the trade.*

# HAVE YOU A CINÉ CAMERA ?

*IF SO — get to know about the P.P.C.*

The **Presenta Pocket Ciné** is unique. In addition to projecting your 9.5-mm. films independent of mains electricity and bulky apparatus, it also allows you to **see** them in motion, without the aid of any artificial illuminant.

No matter where you are, the P.P.C. enables you to show your friends your "pictures" as no other projector can.

Self-contained in an attractive Bakelite case, the P.P.C. slips into the pocket and is always ready for instant use.

For holidays it is ideal, and the unique visualising feature makes it indispensable for "editing," etc.

**25/-**

POST FREE.  
Cash or C.O.D.

Obtainable from all Photographic Dealers, Stores, etc., or direct from

# SPECIALIZATION

A MODERN tendency towards specialization is noticeable in most branches of commerce and industry. This is to be accounted for by the increasing complexity of the civilized existence.

It was the recognition of this fact, coupled with the conviction that the future of photography is with the miniature camera, that led us (forsaking all others) to specialize exclusively in the miniature.

Consequently, although not a full-sized reflex, not a studio or cine camera obstructs the field of vision at 202, High Holborn, our windows are literally filled to the overflowing with a profusion of Leicas, Contaxes and Rolleiflexes. To this we

feel like adding the boast that our second-hand stock of these fascinating instruments is not to be equalled anywhere.

Another point about our business is its extremely personal character. Enquiries of all kinds get the attention of R. G. Lewis himself. Absolutely impartial advice on all matters relating to the miniature camera is available at 202, High Holborn.

Every miniature camera of distinction, including all models of the Contax, Leica, Rolleiflex, Super Ikonta and Exakta, is always to be seen at our premises.

WE WISH TO BUY FOR CASH ANY OF THE ABOVE-MENTIONED CAMERAS.

## OUR PART-EXCHANGE ALLOWANCES WHERE MINIATURES ARE CONCERNED ARE THE HIGHEST IN THE TRADE.

HERE ARE A FEW EXAMPLES OF OUR SECOND-HAND GUARANTEED CAMERAS:—

### CONTAXES:

Contax, slow-speeds model, f/2 Sonnar, ever-ready case. As new	£28 17 6
Contax, as above, but improved 1935 model, f/2 Sonnar, ever-ready case. Indistinguishable from new	£31 0 0
Contax, slow-speeds model, f/2.8 Tessar, ever-ready case	£22 10 0
Contax, Model A (1/25th to 1/1,000th), f/2 Sonnar, ever-ready case	£25 0 0
Contax, Model A (1/25th to 1/1,000th), f/2.8 Tessar, ever-ready case. New condition	£19 0 0
Contax Universal View-finder. As new	£6 0 0
Contax Universal Case	£2 5 0
Contax Wide-angle Finder	18s. 0d.
Albada Finder	£1 0 0
Collapsible Lens Hood	£1 0 0
Cassettes, 8s. 6d. each. 42-mm. Proxars, each 13s. 0d.	

### LEICAS:

Leica Model III, f/2 Summar, ever-ready case. As new	£28 17 6
Leica Model III, f/2.5 Hektor, ever-ready case. As new	£24 0 0
Leica Model II, f/3.5 Elmar, ever-ready case. Good condition	£17 0 0
Another, as above, but indistinguishable from new	£18 0 0
Leica Model II, f/2.5 Hektor, ever-ready case. As new	£19 17 6
Leica Model I, non-interchangeable, case £7 15 0	
Angular View-finder	£1 0 0

# The Amateur's Emporium

## PRIVATE SALE AND EXCHANGE

For Amateurs only.

All advertisements inserted in these columns must be strictly prepaid, and reach the Offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue. Advertisements are inserted, as far as possible, in the order received, and those received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

"The Amateur Photographer" can be obtained abroad from the following: **UNITED STATES:** The International News Co., New York. **FRANCE:** W. H. Smith and Son, 248, Rue Rivoli, Paris; Hachette et Cie, Rue Reaumur, Paris. **BELGIUM:** W. H. Smith & Son, 71-75, Boulevard Adolphe Max, Brussels. **AUSTRALIA:** Gordon & Gotch, Ltd., Melbourne (Victoria), Sydney (N.S.W.), Brisbane (Queensland), Adelaide (S.A.), Perth (W.A.), and Launceston (Tasmania). **NEW ZEALAND:** Gordon & Gotch, Ltd., Wellington Auckland, Christchurch and Dunedin. **INDIA:** A. H. Wheeler and Co., Bombay, Allahabad and Calcutta. **CANADA:** Imperial News Co., Toronto, Winnipeg and Vancouver; Benjamin News Co., Montreal; Gordon & Gotch, Ltd., Toronto. **SOUTH AFRICA:** Central News Agency, Ltd.

**Prepaid Private Advertisement Rate:**  
Twelve words or less, 1/- 1d. for every additional word. Each paragraph is charged separately.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to **ILIFFE AND & Co. SONS LTD.**, and crossed

Notes being untraceable if lost in transit should not be sent as remittances.

## DEPOSIT SYSTEM.

For full particulars see previous issues.

## BOX NO. ADVERTISERS.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

## IMPORTANT NOTICE

Owing to the August Bank Holiday, the issue of "THE AMATEUR PHOTOGRAPHER AND CINEMATOPHOTOGRAPHER" for August 7th must be closed for press earlier than usual.

MISCELLANEOUS ADVERTISEMENTS for insertion in that issue can be accepted up to

FIRST POST, THURSDAY, AUGUST 1st.

## WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

# IN BATH THIS WEEK

AND UNTIL AUGUST 7th.

Exhibition of Dr. Paul Wolff's Leica Pictures at the Pump Room (immediately behind our Cheap Street premises).

See these 24×16 in. enlargements from Leica 1½×1 in. negatives, and be convinced of the practicability of Leica Photography.

We are showing the full range of Leica apparatus, and our Leica expert will be in attendance to explain any point in connection with Leica Photography.

We offer specially generous allowances for cameras in part exchange for new Leica apparatus during the exhibition, and are officially recommended by the makers of the Leica for all Leica processing.

# BIG CASH SALE OF HOLIDAY CAMERAS

—NO EASY PAYMENTS!—NO PART EXCHANGES!  
REAL GOOD HOLIDAY CAMERAS—USED, BUT ALL FULLY GUARANTEED

In order to give the pleasure of photography to many who cannot afford new cameras, we have decided to make this generous offer. Our policy is to increase the number of people using cameras, and we are prepared to make this present sacrifice to this end. Every item is genuinely reduced from our usual second-hand prices.

## FAST AMONG THE FASTEST...

Even man's swift chariot of the sky is brought to a complete "standstill" by the amazing speed of Selochrome Roll Film.

Quicker than thought, Selochrome "sees" and seizes the picture, and—dull weather or bright—reproduces it with all faithfulness and truth.

## Perfect Pictures even in extreme conditions

It is a fact that even with an aperture of  $f/11$  and  $1/30$ th second the Pernox film will give well-exposed negatives, even without sunshine. In addition to its high speed (H. & D. 2,700, Scheiner 26°), the Pernox qualities of good gradation, sensitivity to yellows and greens, freedom from scratches because of its protective coating, and extreme fineness of grain considering its speed, will be appreciated by every amateur who likes to take good pictures in all circumstances. In addition to the orthochromatic emulsion Pernox has now been introduced in

## Pernox Panchromatic

Pernox panchromatic roll films are sensitive to all colours of the spectrum, and will therefore give correct monochrome rendering of colour when used with a suitable filter.

ROLL FILMS

ZEISS IKON LTD., 11, Mortimer House, Mortimer Street, W.1

Don't lose those "never-to-be-forgotten incidents" through wrong exposure. The kiddies are only young once—next year they will have grown out of many of their charming childish ways. It's not worth

risking the result by guessing the exposure. The cleverest photographer can only estimate the light—it is impossible for the human eye to measure it accurately as the Weston meter does. It is simplicity itself to use. You just point the meter to your subject and twist calculator to agree with meter reading, that is all! Correct combinations of shutter speeds and apertures are then indicated. Compensation for different kinds of film is allowed for on the calculator, also for indoor and outdoor subjects. Simple provisions are available for an analytical study of the scene by expert photographers.

**PRICE REDUCTION.** Weston Universal Exposure Meter  
£6 : 15 : 0 cash, or on easy payments, 15/9 monthly.

### NEW REFLEX-KORELLE

Takes 12 pictures on 3½ × 2½ 8-exposure roll film. Film-wind and shutter-wind are coupled, and easily operated by means of a lever. A counter indicates the number of exposures made. Lenses are interchangeable. Stop and distance scales are read from above. Collapsible frame, finder for eye-level exposures. Smooth and vibrationless focal-plane shutter gives time, bulb and instantaneous exposures from 1/10th to 1/1,000th sec. Fitted with lenses from f/4.5 to f/2.8. With f/3.5 Zeiss Tessar. **£15:15:0**

Nine monthly payments of 36/9.

### NEW SALEX CINÉ TRIPOD

The latest example of super "City Sale" value. Made of duralumin for strong wear. Light and compact for carrying. The legs are stout and rigid. Fitted with screw clamping device and panning and tilting device. Cine camera owners will recognise this as remarkable value. Place your order NOW for the holidays **£5:15:0**

Nine monthly payments of 13/6.

### BEST EXCHANGE ALLOWANCES

### 'BRILLIANT'

Takes the standard 3½ × 2½ 8-exposure roll film at 1/100, but gives 12 1/4-in. square pictures. The brilliant image shows almost full size. With Compur shutter. High-grade f/4.5 Skopar lens.

**£6 : 5 : 0**

Nine monthly payments of 14/8.

### PAILLARD

9.5 and 16 mm. Cine Camera.

Semi-automatic loading. Footage indicator. Semi-circular three-lens turret. Tri-focal view-finder. speeds 8, 16, 24, 32, and 64 frames per sec. Still-picture device. Automatic rewind. Dallmeyer f/2.9 lens. **£49**

Nine monthly payments of £5 14s. 4d.

### 9.5-mm. DEKKO

Three speeds—half, normal, slow. For snapshots, time exposures, single and animated. Dallmeyer f/3.5 lens..... **£6 : 6 : 0**

Ross or Dallmeyer f/1.9 lens..... **£9 : 18 : 6**

Nine monthly payments of 14/9 or 23/2.

# A USER'S TESTIMONY TO THE Rolleicord

"Shirley," Grove Lane, Hale, Cheshire.  
22nd June 1935.

"In April I purchased a Rolleicord Camera, Zeiss f/3.8 lens, No. 1593510, from The Sheffield Photo Co., Ltd.

"I have been a keen amateur for over thirty years, both at home and in the East, and have possessed or used every type and make of camera at one time or another, but the Rolleicord is absolutely the finest camera I have handled.

"Since I bought the camera in April I have taken 177 negatives, comprising all sorts of subjects, under all lighting conditions, with and without Proxar lenses, and every single exposure has been needle sharp and in every way a delight.

"I have used reflex cameras, with and without magnifiers, but I have never used any camera with more confidence of obtaining dead accurate focus and a certainty of a real 'picture' on every negative.

"It is a delight to handle, precision built and beautifully finished.

"I am so enthusiastic over the camera that, although I hate writing letters, I feel it is only due to you to know how satisfied I am.

"I have sent some of the best of my pictures in for the competition and now that the closing date has been extended I shall send others.

"I like the square 'format' immensely."

Yours faithfully,  
(Signed) ROYD BURNE.

**T**HE AMATEUR PHOTOGRAPHER index is now on sale for Vol. LXXIX, January to June, 1935, and it is rather more voluminous than usual owing to the quantity and variety of the matter included. Following the usual form it is divided into three sections—Letterpress, Illustrations and Contributors. It is obtainable from our publishers, Messrs. Iliffe and Sons Ltd., Dorset House, Stamford Street, London, S.E.1. The price is 3d., or by post 4d. Also available are the lettered cloth covers for binding up the parts for the half year. The price of these is 3s. 10d. by post, from the same address.

### Exposures at the Seaside.

While it is correct to say that the actinic value of the light is higher at the seaside than anywhere else, it is quite possible to secure under-exposed negatives during the sunny hours even on rapid films. We have seen quite a number of seaside snapshots recently that were definitely under-exposed. The photographer had relied on the generally accepted statement that you cannot under-expose at the seaside, and had given the minimum exposure with a very small stop. These factors should only be made use of when a very open view, such as the sands and the sea and sky, form the subject. When, however, familiar foreground objects such as figures in dark clothes, boats and rocks are included the conditions are altered and, as with most other subjects, the exposure should be for the shadows and not for the high-lights. It is true it will be less than for the same subjects inland, but will be much more than for the open beach scene. This point should be remembered by beginners who may find their

## TOPICS of the Week

### A Weather Forecast

FOR THE WEEK

By D. K. BARTLETT.

#### THURSDAY, AUGUST 1st.

After early morning haze and mist some bright and sunny weather will occur with warm temperatures, particularly towards the Western half of England and Wales.

#### FRIDAY, AUGUST 2nd.

Continuing similar weather conditions generally, although it may be rather more cloudy and less bright in places, especially farther North in Scotland and in the West towards Ireland, and thundery later in the South-East of England.

#### SATURDAY, AUGUST 3rd.

The less settled conditions are likely to increase in the Eastern half of England and where the thundery weather may break to bright and sunny periods across to the West into Ireland, where unsettled, changeable weather will be general.

#### SUNDAY, AUGUST 4th.

Wind or breeze with cloud will tend to make the atmosphere dull, and thunderstorms will occur early and late in the day, especially in the Eastern half of England. It will be somewhat brighter farther West and along the South Coast. Ireland changeable and Scotland fair, some cloud.

#### BANK HOLIDAY,

#### MONDAY, AUGUST 5th.

Improved to sunny periods locally, where it has been unsettled with warm temperatures through England. Haze or mist will occur across the Midlands and some drizzle towards Ireland and farther North.

#### TUESDAY, AUGUST 6th.

Much sunshine and fair conditions with warm temperatures generally with a heavy atmosphere causing haze or mist during the day, and thunderstorms in the Eastern Counties during the evening.

#### WEDNESDAY, AUGUST 7th.

Warm temperatures with some thunder in the Eastern Counties, to fine and slightly cooler with clearer atmospheres towards the West of England and Wales. Remaining changeable over Ireland, and cloudy intervals will occur in Scotland.

seaside snaps very hard and black and white when they get their packet of prints from the local D. & P. man during the holidays.

### Carrying the Camera.

We have lately been watching how various people carry their cameras. Continental folk seem to favour far more than we do the camera depending from the leather strap worn round the neck. Perhaps they like to have their hands free for gesticulation. The Englishman, who never knows what to do with his hands—that is why he takes to silver-mounted walking-sticks and cigarettes—is rather glad of a camera as something to hold on to. It serves quite an important part in nervous control. The pocket for the camera is a little out of favour, for although many cameras are made very nicely to go into the pocket some of them spoil the set of the close-fitting coats which are the modern wear. It was different in the days when frock coats were worn, when one could almost get a half-plate camera in the tail pocket and the bandana handkerchief in addition, not to speak of a pound of sweets for the children. When the camera is carried in a satchel one can almost tell the nationality from the position in which it is carried. The Frenchman has it neatly at his side, but the German likes to have it dangling exactly in front of him. The Englishman carries it on his back.

### Photography in the Riviera.

Visitors to the Riviera should note that by a new regulation regarding photography and sketching near fortifications practically all the Riviera east of Nice is now out of bounds for the camera, since in no place in that region is one more

than a mile or so from a fortified area. Permits may, however, be obtained from the military authorities in Nice for landscape work by amateurs. This information has been sent to us by a correspondent in the South of France who tells us also of an event that will interest readers who may be travelling in the neighbourhood of Roquebrune (Village) A.M.—near Nice. It has occurred annually on August 5th since 1476, and takes the form of a quite unspoilt, and unexploited, Passion Procession. It is conducted with the utmost reverence, and depicting, as it does, many ancient costumes such as those of Roman Lictors worn at the time of the Crucifixion, passing through ancient archways, cobbled streets, and beautiful scenery, provides a wonderful subject for the photographer. Its one drawback is the fact that the

intense sunlight may prove troublesome for picture-making. The extreme brilliancy of the midday sun almost directly overhead, and lack of "atmosphere," render the shadows very black, and the results are apt to be of the "soot-and-whitewash" order unless full exposures are given.

### Mountains and Mice.

A turbot, we believe, lays ten million eggs, so that if all the eggs of all the turbot became in their turn turbot the ocean would be so full of this particular fish that there would be no room for any water. By a wise provision only about one egg in a million yields a turbot. There is not quite the same antenatal mortality among the pictures taken by Press photographers, but sometimes we have an idea that it is not far short of it. At a stone-laying ceremony the other day we

observed a large number of Press photographers whose cameras were lined up side by side on a table, and they all got busy when the moment came, but we came across only one picture of the event in the several newspapers we examined. Similarly, when royalty attended a village function a dozen photographers kept in step, but again only one published picture revealed itself. When Mr. Lloyd George delivered his speech to his Council of Action it was punctuated by flashes from portable photographic apparatus so constantly at one point as to resemble lightning, to which the applause was the accompanying thunder, yet only a small percentage of the results can have reached print. But if every exposure meant a published picture, we expect, to parody the words of the evangelist, the world itself could not contain the picture pages.

## READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with on this page week by week. Other replies appear as usual on the last page.

### Shutter Efficiency.

*Can you give me in a simple way an idea of the term "efficiency" when applied to shutters? I know it has some special meaning, but am not sure to what property of a shutter it refers.*  
E. L. (London.)

It is an easy matter to get an idea of the significance of the term, and in some cases the efficiency of a shutter is a very important factor.

With most shutters it is quite easy to imagine three phases—the time the shutter takes to open fully, the time it remains fully open, and the time it takes in closing completely. The middle period may be relatively long or short, and the times taken in opening and closing vary considerably with different shutters.

In the top row in the diagram is a suggestion of what happens with a shutter of the "guillotine" type, in which one metal plate slides quickly over the surface of another, and at one period in the journey openings in the two plates coincide so that light can pass through. The phases shown are—shut, half-open, open, half-shut, shut. The last (6th) circle shows the condition of things if the opening in the moving plate were not large enough to uncover the full aperture of the lens.

The second row shows what happens with a roller-blind shutter before or behind the lens, and the resemblance between this and the guillotine shutter is obvious.

The third row illustrates the familiar diaphragm shutter.

As this works, the small central aperture which first appears becomes progressively larger till it reaches its maximum diameter, and then reverses its movement till closed again.

It is evident that the aperture of the lens is fully operative only for a part of the total exposure; and it is the proportion of this time of full exposure to the total exposure time that is the measure of efficiency. It is also evident that no such shutter can have 100 per cent efficiency.

Practically no shutter has full efficiency. This might be obtained with a blind shutter working at the actual focal plane, but the farther the blind is removed from the focal plane the greater is the loss of efficiency.

Further thought will show that the efficiency of a shutter varies according to circumstances, and this may be conveniently considered in relation to the diaphragm or iris shutter, as illustrated in the third row of the figure. It may be assumed that the shutter is in perfect working order.

Suppose the shutter is set for 1/100th second. Light begins to pass as soon as an opening is formed, becomes stronger and stronger as the opening enlarges, and is then progressively dimmed to complete extinction again. The time of full opening is relatively short. Now suppose the shutter is set for one second. The times taken for opening and closing are about the same as before; therefore, the time of full opening is relatively long. In other words, efficiency is very high.

The other factor which affects efficiency is the size of the lens aperture in comparison with the shutter aperture. The second phase of the shutter in the diagram may already have opened the stop, which remains operative while the shutter is travelling to phase three, and back to phase four. So that the efficiency will be higher for a small stop than for a large one.

Exposures given in tables, and for calculators and meters, make some allowance for loss of efficiency in shutters. Thus, if an exposure of 1/100th of a second is suggested it means the actual exposure that may be expected from a shutter of good type and in perfect working order. In no case is the whole of the light passed by the lens acting on the emulsion for the whole of the 1/100th of a second.

# USING FILM PACKS

Film packs have many outstanding advantages for the hand camera worker. This article is written for the benefit of the photographer who is not familiar with them, and is using them for the first time on the annual holiday.

**P**HOTOGRAPHERS can sometimes be heard questioning the reliability of the film pack, in spite of the rapidly increasing popularity of this form of negative material. It is true that the older type of film pack often produced defective negatives, but this was frequently due to careless handling by the amateur.

It is safe to say that in its modern form the metal-cased film pack can, if properly used, be relied upon to produce twelve good negatives to the dozen. It should be pointed out that the adapter must be above suspicion, and the photographer prepared to handle the pack with care.

## The Adapter.

It is probably true to say that most of the fogged negatives produced upon film packs are the fault of the adapter, rather than the pack. It must also be admitted that the modern film pack is a much better article than was the card-cased pack of twenty years ago. Moreover, the film-pack cases are now more or less standardised with regard to the size, and there is no need for the photographer to be confined to one.

The pack should be held tightly in the adapter, but no force should be necessary to insert or to withdraw it. On the other hand the pack should not be held so loosely that it will slip about after the adapter has been closed. A very good, if rough and ready, test is to hold the adapter with the pack in position with the back open; the pack should fall out by its own weight.

If the fit is too tight, fog may appear on the negatives, because the pack will be forced open. If it is too loose, the negatives may show parts of the subject out of focus. These considerations apply to the older adapters and packs, rather than to those of modern manufacture. It is well to remember that wooden adapters can be bought for a shilling or so that go inside the usual metal adapter, and permit a smaller size film pack to be used. This is consequently very useful when the usual full-size film pack cannot be obtained.

## The Pack.

While under all ordinary conditions the pack is lightproof, the photographer will be well advised to give as much protection as possible when

loading or removing the pack from the adapter. This is especially the case with panchromatic material. Once the pack is in the adapter only ordinary precautions are necessary.

Care should be taken when handling the pack not to squeeze or bend the case, and not to touch the safety cover, which would admit light. The film pack should be handled by holding only the two longer sides, in the same fashion as one cuts a pack of cards. After exposure the pack should be replaced in its protective foil wrapping and not left exposed to strong light.

## The Pack in Use.

There are one or two essential points that should be observed, and, while they are obvious, many photographers neglect them. Make sure that all the visible tabs of black paper on which the numbers are printed are together when the back of the adapter is closed, and be sure to note that No. 0 is the first to be seen. This is often a mysterious number to the novice. It is not fixed to any sensitive material, but acts merely as a protective and light-proof cover to No. 1 film. It is obvious, then, as soon as the pack is in position and the back closed and secured, and the metal sheath in position, that No. 0 tab can be pulled out and gently torn off. The first film is now immediately next to the metal pull-out sheath of the adapter and awaiting exposure.

After each exposure the paper tab should be drawn straight out gently, and not jerked out, or pulled at an angle. The latter involves the risk of detaching the film from the paper backing, with the result that it is not changed, and unknown to the photographer the other exposures are all made upon the same film.

The paper, when pulled out, should also be torn off gently, and not wrenched off, and care exercised not to bend the paper against the back of the opening, which may permit light to enter. The paper tabs must also be drawn out to the full extent, as indicated by a printed mark.

Some workers prefer to cut off the black paper, after pulling it out, with a small pair of scissors which they carry for this purpose. This prevents the possibility of light creeping in at the end, which can happen when the tabs have to be pulled hard

against the velvet in order to tear them off. After the last tab, indicated by No. 12, is pulled out, the whole of the pack is now safely behind a stiff and opaque cover. It is now quite light-proof, and can be taken out in the daylight for reloading purposes.

## Preparing for Development.

When about to develop the film pack read the instructions which are usually included in the carton, and learn how the metal container top should be removed to release the films. This, of course, should be done in the dark-room.

Now, with the cover removed, place the metal case face upwards on the table, and, holding it by the two side edges, remove the films one by one and place in an empty plate box.

The best way of dealing with film-pack exposures is by tank development. The paper backing should be removed from the films before development, as if left in contact the resulting negatives may show curious matt-like markings on the celluloid side.

## Dish Development.

If dish development is decided upon, the photographer will have to resist the temptation to develop too many films at once. The beginner is advised to develop two at a time before he tackles a whole pack at once in a dish.

Because most film packs are coated with an extra scratch-preventive emulsion, longer time than usual must be given in developing, about twenty-five per cent, to allow the developer to penetrate to the sensitive emulsion.

In the case of panchromatic films desensitising is a necessary preliminary. It is an easy matter to detach the protecting papers, and to immerse the films in the solution, where they may remain without harm, until taken in turn for development. Make sure that they are not overlapping each other; otherwise the emulsion may be desensitised in patches only. Use deep dishes, and plenty of developer.

After washing, it is a good plan to give the films one minute in a weak solution of one per cent acetic acid. This will remove any deposit formed in the washing water. The films are then given another brief wash, wiped with a damp "chamois" and pinned by one corner to a shelf to dry.

# EXCUSE OUR BACKS—

*but the Photographer may prefer them!*

By PETER W. HILL.

EACH summer must see many tens of thousands of films exposed on holiday groups of very camera-conscious friends and relatives. Each member of such groups has usually noticed the photographer long before the shutter clicked. Hence the series of wooden expressions which are adopted by so many at sight of a camera.

Try taking a few back-view photographs this year for a change. It

*A halt to look at the river.*

and secure an unusual record of a happy holiday. But this time it will probably be more than a record—it may be a picture.

*The view below.*

will add vastly to the interest of your holiday album, for there will be just that little difference that the others have not got.

The greatest advantage of back-view photographs is their naturalness, for none of the subjects are usually aware of the camera and are consequently unposed. That great bugbear of natural-looking snaps—camera consciousness—is entirely avoided. The non-photographic members of a party are usually accustomed to the camera enthusiast wandering off on his own to bag something attractive; consequently, he can occasionally drop behind unnoticed, wait until his friends, interested in some common object, are grouped to his satisfaction,

*Crossing the sands.*

 T. and B. **£27:10:0**

Nine monthly payments of 54/10.  
 $f/3.5$  Tessar anastigmat, **£27:10:0**  
 Nine monthly payments of 64/2.

### THE DEKKO CINÉ CAMERA

for 9.5-mm. films.  
 British Made.

20-mm.  $f/3.5$  Dallmeyer anastigmat (fixed focus), interchangeable screw-in lens mount. Variable speeds, half to normal and slow motion, 64 pictures per second, single picture device, spring drive motor, taking through full 30 ft. of film at one winding, telescope type finder, built inside the camera, body of special wear-resisting bakelite. All outside fittings and film gate **£6:6:0**  
 chromium plated **£6:6:0**  
 Nine monthly payments of 14/9.

body of special wear-resisting bakelite. All outside fittings and film gate **£6:6:0**  
 chromium plated **£6:6:0**  
 Nine monthly payments of 14/9.

### WESTON Photo-Electric Cell Exposure Meter.

Model 617/2, for "still" or ciné camera, complete in case **£6:15:0**

Nine monthly payments of 15/9.

Model 617/2, for use with the Leica camera **£7:0:0**  
 Nine monthly payments of 16/4.

## ALL OUR SHOPS are LEICA SHOPS

### LEICA

THE CAMERA OF MODERN TIMES.

Its small size; its quick-as-thought readiness for use; its absolutely exact automatic focussing; its high-precision focal-plane shutter; its convenient manipulation, make the Leica the ideal Sports and Press camera, and create

for the amateur possibilities of work such as are given by no other camera.  
 Model IIIa, fitted with 5-cm.  $f/3.5$  Elmar Standard lens, focal-plane shutter, 1 to  $1/1,000$ th sec., T. and B. All chromium plated **£34:0:0**  
 Nine monthly payments of 79/4.

Model IIIa, 5-cm.  $f/2$  Summar anastigmat, all chromium plated **£43:0:0**  
 Nine monthly payments of 100/6.

Model III, with 5-cm.  $f/3.5$  Elmar anastigmat, shutter speeds 1 to  $1/500$ th sec., T. and B., all chromium plated **£31:16:0**  
 Nine monthly payments of 74/3.

Model III, with 5-cm.  $f/2$  Summar anastigmat, all chromium plated **£40:16:0**  
 Nine monthly payments of 85/3.

### WESTMINSTER SPECIAL OFFERS

#### THE "SPRING" BOX

Folding Roll-film Camera.

8 pictures  $1\frac{5}{8} \times 2\frac{1}{2}$ , or  
 16 pictures  $1\frac{1}{8} \times 1\frac{1}{8}$

Quickly ready for use. A touch of the button and the camera opens and is ready for use. Double lens  $f/11$ , with movable supplementary lens for taking pictures at distances less than 6 ft.

COST 37/6  
 OFFERED AT **23/9**

### MODEL 4 ENSIGN KINECAM

16-mm. (British made.)

NEW and UNSOILED **87/6**

COST £10:10:0

Nine monthly payments of 10/4.

Perfect mechanical construction, 2 film speeds, 8 and 16 pictures per second, 20-mm.  $f/3.5$  Taylor-Hobson anastigmat, fixed focus, straight-through telescopic type view-finder, spring motor drive. Exposure indicator attached to side plate, film footage meter. Interchangeable lens fixture permitting the use of long-focus and Telephoto lenses. Takes 50 ft. of daylight-loading film. Exceptional Value.  
 Leather Case, velvet lined, 10s. 6d.

Liberal Exchange Allowances. Hire-purchase Terms.

## The WESTMINSTER PHOTOGRAPHIC EXCHANGE, LTD.

119, VICTORIA STREET, 111, OXFORD STREET,  
 VICTORIA 0669. S.W.1 GERrard 1432. W.1

Appointed an Associate of the Institute

of Amateur Cinematographers, Ltd.

### THE NEW REFLEX-KORELLE

Self-capping focal-plane shutter, speeds  $1/100$ th to  $1/1,000$ th sec.

$f/3.5$  Schneider Radlona anastigmat, double exposures an impossibility, the lever shutter being coupled with the film-wind. Interchangeable lens mount. Stops and distance scales are read from above. Collapsible frame finder for taking pictures at the eye-level. All metal, leather-covered body. Takes 12 pictures  $2\frac{1}{2} \times 2\frac{1}{2}$  on standard  $3\frac{1}{2} \times 2\frac{1}{2}$  roll film, complete in leather **£11:15:0**  
 c.s.e. **£11:15:0**  
 Nine monthly payments of 27/5.

### THE NEW VOIGTLANDER BESSA

Takes 8 pictures  $3\frac{1}{2} \times 2\frac{1}{2}$  or 16 pictures  $2\frac{1}{2} \times 1\frac{1}{8}$  on standard  $3\frac{1}{2} \times 2\frac{1}{2}$  roll films, 620 or 120 size.

New design base-board which ensures perfect rigidity. Unique trigger release fitted under the base-board. Supplied in 8 models.

#### PRICE

$f/3.5$  Voigtar anastigmat, Pronto 3-speed shutter **£3:12:6**

### "AGFA SPEEDEX"

MODEL "O." Takes standard V.P. roll films.

Fitted  $f/3.9$  Solinar anastigmat in Compur shutter, speeds 1 to  $1/3000$ th sec., T. and B., self-erecting front, optical direct-vision finder **£5:5:0**

Nine monthly payments of 12/2.  
 $3\frac{1}{2} \times 2\frac{1}{2}$ ,  $f/4.5$  Agfa Solinar anastigmat, delayed-action Compur shutter, speeds 1 to  $1/2500$ th sec., T. and B. **£7:7:0**  
 Nine monthly payments of 17/2.

### THE GUCKI

Takes 16 pictures on standard V.P. roll films.

$f/2$  Xenar anastigmat, Compur shutter, speeds 1 to  $1/3000$ th sec., T. and B., optical direct finder, hinged back, metal body, leather covered, complete in ever-ready case **£16:14:6**  
 Nine monthly payments of 39/9.

# MINIATURE CAMERA

By  
MERLYN SEVERN.

## NOTES

Fig. 1. Leica with Telephoto lens and grip as described below.

THE foundation-stone of successful miniature work is a rock-steady camera. Miniature negatives are always enlarged, often to many times their original size, and a faint tremor at the moment of exposure will result in a slight blurring of definition, which would pass unnoticed in a contact print from a large negative, but becomes painfully obvious in a six or eight times enlargement.

Novices in this branch of photography will derive much benefit from a few minutes' drill with an empty camera, every time a finished spool is removed. Since no picture is being taken, the whole attention can be concentrated on this matter of steadiness. First be sure that you are holding the camera in the most comfortable position; no rules can be laid down about this, everyone has his own method.

Now stand evenly balanced on both feet, take a moderate breath, hold it, and press the release with a gentle squeezing movement, watching carefully through the finder to see whether there is any camera-shake. After a little practice, the procedure becomes automatic and is carried out unconsciously while the conscious attention is fixed on the subject being photographed.

With a camera taking interchangeable lenses I found it extraordinarily difficult

to carry out rule No. 1 with a long-focus lens in position—to hold the camera really comfortably. The weight of the lens, being all to the front, seemed to make the camera top-heavy; and when

carpenter or handyman would make one up for a shilling or so.

I hunted out a  $3\frac{1}{4}$ -in. bolt with a thread that fitted the tripod bush—it happened to be an old bicycle spindle—and a block of soft wood  $3 \times 2 \times 1$  in. I drilled a hole through the block, lengthways, to take the bolt (making it a tight fit), and countersunk a larger hole for the head. A smear of "Secotone" on the threads before the bolt was driven into the hole further ensured that it would not turn round in the handle. With chisel and knife I whittled the wood to a comfortable grip, and my handle was ready (Fig. 1).

Figure 2 shows what a comfortable and natural "hold" it gives with a Leica.

I was now equipped for all speeds faster than, say,  $1/20$ th. But indoor snapshots and night pictures often require  $\frac{1}{2}$ ,  $\frac{1}{4}$ , or even 1 second. Only the most expert can hold a miniature steady in the hands for these times, and it is not always practicable to set up a tripod, for instance, in a busy street, or when one is perched on a window-sill or a balustrade.

Here the solution was found in a Unipod; and by the simple device of cutting the crook off an old walking-stick and fixing a tripod-bush to its base by means of a brass collar, it was made extremely portable. It hangs, unnoticed, over my arm when both hands are occupied; it

is just the right length to carry a bag of accessories, such as lunch and lenses, workman fashion; and fully extended it proves useful in various unexpected ways, such as pulling down otherwise inaccessible branches to photograph flowers or birds' nests, and handing objects across a stream.

Fig. 2. The Miniature Camera with Telephoto lens in action.

I grasped it round the barrel, rifle-fashion, my fingers obstructed the view through the range-finder. Fortunately, most of these long-focus lenses are fitted with a tripod-bush in the barrel, and this suggested the idea for a gadget which solved the problem. I made mine myself, at no cost at all, from odds and ends in my workshop; but any

## KEEP THE LENS CLEAN

WHEN dust and smears appear on the surface of a photographic lens crisp definition and brilliancy in the negatives will be difficult to secure. Particularly does this apply to miniature camera lenses. There is a great temptation to take out the handkerchief and rub the lens when it looks dirty, and after this has been done a few times the fine polish of the glass begins to suffer, imperceptibly at first, but it is only too obvious after several months of regular cleaning.

Sometimes it is the fault of the harshness of the fabric, and sometimes it is due to the dust in the handkerchief, acting as a fine abrasive, generally it is both. It is a far better plan to use the special lens-cleaning materials sold for this purpose. When they are fluids they must be used sparingly; it needs

only a mere dampness on the fabric to clean the glass thoroughly. Never by any means flood the lens with the spirit. It will not clean it any quicker, and there is a big risk of the fluid creeping past the lens into the next component, and should that happen to be a cemented combination it will be a costly business to put right again.

There is another type of material for the purpose which is not as popular as it deserves to be. This is the special lens-cleaning tissue. It is sold usually in small packets about four inches square containing about ten sheets. The total thickness being less than  $1/16$ th in. it is very convenient to carry in the camera wallet. Each sheet of this Japanese tissue is attached by one corner only, and is easily detached for use.

July 31st, 1935

# FAIR

By  
ARTHUR G. DELI

*Looking Down. 1/50th sec., f/8. Verichrome.*

PLEASURE fairs are not of such great antiquity as market fairs; mostly have they sprung up as a side-line to the latter and by degrees developed into fairs held entirely for amusement.

Even so, pleasure fairs are an ancient institution, and like many other old-world customs are becoming scarcer with the passage of years, chiefly owing to the rapid growth and variety of more modern entertainments.

Fortunately there are quite a number of them still on the road, and during the summer months they are to be found at their usual pitches throughout the country, inviting all and sundry to "walk up."

A fair-ground is generally a congested area at the best of times, therefore choice of viewpoint is often sadly restricted. A good plan is to arrive on the scene early and get busy with the camera before the place is unduly crowded.

Many fine types are to be discovered among the gipsies of a fair, and a time when business is slack is often a splendid opportunity of getting some head-and-shoulder or close-up studies. Mostly they will be found very willing to pose.

When the fair is very gay and crowded, a walk round the outside edge will probably be productive of some worth-while subject matter, and here the restriction of viewpoint will not be so pronounced, thus giving a better chance of "stalking" and securing groups that are not at all camera-conscious.

To the seekers after unusual viewpoints a pleasure fair offers countless opportunities. The expenditure of a few pence

*A corner of the Fair. 1/100th sec., f/6.3. S.S. pan.*

*Flying Swing. 1/250th sec., f/6.3. Selochrome.*

on the helter-skelter (or others of that ilk) will permit of exposures being made from various elevations, looking down on the roundabouts below.

Two attractive subjects for pictures that are sure to be attempted, but not always with successful results, are the swings and roundabouts in action. For a swing in action it is necessary to watch the nearest "boat" and release the shutter when it is at the highest point before returning. At that moment it is practically stationary. But one must not overlook the other boats that may be at the bottom of the swing and

travelling fast; they will, however, be farther away. In the case of roundabouts, never attempt to photograph these when in full blast and broadside on; the result will be a blur. Either take the horses and their riders as they approach round the curve or else take them as the machine is slowing down.

The introduction of the hypersensitive panchromatic plate has put yet another power in the hand of the amateur photographer, not only for the above subjects, but to the possessor of a camera with a very rapid lens (f/3.9 or larger aperture) a fair at evening should offer wonderful opportunities of securing something quite new in the way of pictures.

# Photography

The day of arrival of the fair, or again, the day of departure, gives quite as many subjects for picture-making as a fair in full swing.

Unloading or loading up the caravans, rigging up or dismantling the booths and tents, or cooking food over a camp fire, are just a few of the more ordinary happenings of the Romany's existence, and are all good subjects for camera pictures.

Any type of camera is suitable for this kind of work (the accompanying illustrations were taken with a reflex and a roll-film camera, both  $3\frac{1}{2} \times 2\frac{1}{2}$  size), although the advantages of an instrument fitted with a direct-vision view-finder are obvious.

With regard to exposure it is well to remember that a great deal of side-light will be cut off by the surrounding stalls, etc.,

*On the outskirts of the Fair. 1/50th sec., f/8. Selochrome.*

leaving one to contend with a strong top-light and probably shadows of considerable depth. For this reason the fastest plates or films should be used, and the exposures kept as short as possible to avoid movement.

The outer edge of the fair-ground and any open spaces (generally very scarce) in the fair itself are invariably better served with reflected light, and can be considered as more normal subjects when reckoning the exposure.

Many quite ordinary happenings can be greatly enhanced by being taken against the light, but here again under-exposure must be guarded against, also it will be found essential to use a very efficient lens hood to avoid getting flare in the result.

Many of the fairs make their stay for a considerable period in the neighbourhood of popular holiday resorts. In these cases the visitor will have plenty of opportunities to visit the fair a number of times and try various phases of the subject under different lighting conditions. It will be possible in these circumstances to ascertain the least crowded times and the best view-

*Watch for the top of the swing to make the exposures, the boat is then nearly stationary. 1/100th sec., f/6.3. S.S. pan.*

points, and a few preliminary shots, developed by the local D. & P. man, will also prove a useful guide for correct exposures and more considered compositions. It is a subject that ought to provide one or two real exhibition pictures.

*If photographing the roundabout, broadside on, at close quarters wait until it slows down before exposing. 1/100th sec., f/5.6. S.S. pan.*

# NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

A complete set of photographs of pot-holes taken by the late Mr. H. Wadsworth Haywood have been asked for by the British Museum. The series of photographs is contained in two large albums comprising nearly four hundred pictures and covering some twenty pot-holes. Many of these were taken hundreds of yards under the ground. Mr. Haywood was President of the Leeds Cave Club and a prominent member of the Leeds Camera Club. It will be remembered that he contributed an article on the photography of pot-holes to "The A.P." some time ago, just previous to his death. He also lectured on the subject about the same time to the Royal Photographic Society.

The Cape Town Photographic Society announces an International Salon of Photography which will be held at the Technical College Hall, Cape Town, in January, 1936. Entries are due on November 19th, and should be addressed to the Salon Secretary, Richard Dekenah, Esq., P.O. Box 2431, Cape Town, South Africa. A number of entry forms have been sent to us, and will be supplied to readers who forward a stamped addressed envelope for the purpose.

The Streatham and District Photographic Society has changed its Hon. Secretary. This position is now occupied by Mr. E. J. Wiseman, 14, Wharfedale Gardens, Thornton Heath, Surrey, to whom all communications should be addressed.

For the second time the Independent Film Makers' Association are sponsoring a Summer School, which is to be held at St. Margaret's School, in the little village of Lockleys, Welwyn, Herts, from Friday evening, August 2nd, to Monday afternoon, August 5th. The accommodation charge (including meals from Friday dinner to Monday tea) will be within 25s. and 27s. 6d. The school is in beautiful grounds, and there are facilities for

sports, including boating. Among the well-known film people whom it is hoped will be present as lecturers are Anthony Asquith, Andrew Buchanan, Alberto Cavalcanti, Arthur Elton, John Grierson, Stuart Legg, Walter Leigh, Len Lye (colour), Erno Metzner, Paul Rotha, Berthold Viertel and Basil Wright. Professional and amateur films will be projected during the week-end. If any members would like to have their own films projected at this time, particulars, with approximate times of running, etc., should be sent in to the organisers when application for booking is made. Address letters to the Organisers, I.F.M.A., 32, Shaftesbury Avenue, London, W.1.

The London Garden Society is holding a competition open to members of all photographic societies within the Metropolitan Police area and affiliated to the Central Association or to the R.P.S. Silver and bronze medals are offered for the best flower studies and best studies of London gardens. Entries close August 25th. All information and rules from the Hon. Organiser, The London Garden Society, 47, Whitehall, S.W.1.

The 40th Annual Exhibition of the South London Photographic Society will be held in the South London Art Gallery, Peckham Road, London, S.E.15, from 15th February to 14th March, 1936. The closing date for entries is 21st January, 1936. There will be one class only, any subject. Entrance fee, 1s. per print. Silver medal, bronze medal and certificates of merit will be at the disposal of the Judge. Further details and entry forms can be obtained from Hon. Exhibition Secretary, H. S. Adams, 40, Stockwell Park Road, London S.W.9.

A photographic competition for pictures of the Lake District has been organised by the "Friends of the Lake

District." There is no entrance fee, and cash prizes are offered for the best prints sent in by September 30th. Any of our readers who have taken photographs in this district should write for full particulars from the Hon. Secretary, "Friends of the Lake District," Sawrey House, via Ambleside, Westmorland.

We have received a very informative and well-illustrated little booklet entitled "How to make Printing Blocks," which deals in a clear and practical manner with a subject that frequently puzzles readers of "The A.P." It is obtainable from Messrs. Hunter Penrose, Ltd., 109, Farringdon Road, E.C., or direct from the author, J. B. Aikin, 105, Middle Abbey Street, Dublin, price 2s. 3d., post free.

A new photographic society for Shrewsbury is in course of formation. All amateurs in the neighbourhood who are interested and are desirous to join should communicate with Mr. Gorrall, 5, High Street, Shrewsbury.

Messrs. Browne & Nolan, Ltd., 41 and 42, Nassau Street, Dublin, have now become wholesale stockists for Granville Gulliman & Co. in Dublin, and a comprehensive range of Granville materials are being carried by them.

The Annual Sports Meeting of Ilford Limited was held on Saturday, July 13th, on Priest Lane Sports Ground at Brentwood. This year, in addition to the employees of Ilford Limited at the Ilford, Selo, Park Royal and Watford factories, members of the Hoffman Athletic Club, the Howards Sports Association and Schweppes Sports Association were invited to join the meeting, with very successful results. Selo again carried off the Inter-company Championship of Ilford Limited. Col. V. B. Ramsden was the referee, and Sir Ivor Philipps, the Chairman of Ilford Limited, congratulated the winners of the various events in a short speech. Lady Philipps presented the prizes. The sports were followed by a dance at the New Drill Hall, Brentwood.

## Exhibitions and Competitions

CURRENT AND FUTURE.

Notices of forthcoming exhibitions and competitions will be included here every week if particulars are sent by the responsible organisers.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers. Entries, August 31. Rules in this issue.

California Pacific International Exhibition, San Diego.—May 20—November 11. Particulars from Miss Ruth Kilbourne, Exhibition Headquarters, Balboa Park, San Diego, Cal., U.S.A.

Paris International Salon.—October 5-20. Secretary, M. E. Cousin, 51, Rue de Clichy, Paris.

Szeged (Hungary) International Salon.—August 4-21. Particulars from Secretary, Magyar Amatortyenykepek Szovetsege, Csoporthonak, Szeged, Hungary.

Southern Counties Salon (organised by Camberwell C.C.).—August 11-31. Hon. Salon Secretary, W. Bertram, 45, St. Lawrence Road, Brixton, S.W.

South African Salon (Johannesburg).—August 26-31. Hon. Secretary, Johannesburg Photographic Society, P.O. Box 7024, Johannesburg, South Africa.

Amsterdam International Salon.—Entries, August 1; open, September 14-20. Further particulars from Focus, Ltd., Fotosalon, Bloemendaal, Holland.

London Salon of Photography.—Entries, September

4; open, September 14—October 12. Further particulars from Secretary, London Salon, 5a, Pall Mall East, S.W.1.

R.P.S. Annual Exhibition.—Entries, August 16; open, September 14—October 12. Further particulars from Secretary, 35, Russell Square, W.C.1.

Irish Salon (to be held at Mansion House, Dublin).—Entries, September 14; open, November 2-9. Particulars from Hon. Secretary, Irish Salon of Photography, 18, Morehampton Road, Dublin.

Rotherham P.S. International Exhibition.—Entry forms due, September 23; prints, September 30; open, October 16-19. Hon. Exhibition Secretary, E. George Alderman, Ruardean, Newton Street, Rotherham, Yorks.

Indian International Salon (promoted by Camera Pictorialists of Bombay).—Entries, October 1; open, November 17-30. Hon. Salon Secretary, F. R. Ratnagar, Central Bank Building, Fort, Bombay, India.

G.W. Rly. "Camp Coach" Holiday Competition.—Prize, one week's holiday in camp coach during 1936 holiday season. Photographs should depict any aspect of camp coach holiday. Entries due,

October 31. Further particulars from Superintendent of the Line, G.W.R., Paddington Station, W.2.

Canadian International Salon, National Gallery of Canada, Ottawa.—November 6-21, and afterwards in other Canadian cities. Entries due, September 20. Entry forms and further particulars from Exhibition Secretary, Canadian International Salon, National Gallery of Canada, Ottawa, Canada.

Cape of Good Hope International Salon (under the auspices of Cape Town P.S.).—Entries due, November 19; open, January, 1936. Hon. Salon Secretary, Richard Dekenah, P.O. Box 2431, Cape Town, South Africa.

Leicester P.S. International Exhibition.—Entries, January 24, 1936; open, February 24—March 7, 1936. Exhibition Secretary, H. Foscutt, 19, Doncaster Road, Leicester.

The 40th Annual Exhibition of the South London P.S.—Open, February 15—March 14, 1936. Entries close, January 21. One class, any subject. Further details and entry forms from Hon. Exhibition Secretary, H. S. Adams, 40, Stockwell Park Road, London, S.W.9.

# The Two Point Setting

① ON THE FOCUSING SCALE.

② ON THE DIAPHRAGM. The Nettar "Two-point setting" is a great facility for the amateur photographer when on holiday or touring. You place the index of the focussing scale on the red dot, and the diaphragm pointer to another red dot. Use  $1/25$ th second and all outdoor subjects such as landscapes or portraits will be well exposed and defined in any bright light during spring and summer. Moreover, this feature does away with focussing difficulties, since everything from 10 ft. to 12 ft. onwards is rendered perfectly sharp. The "Two-point setting" is only one of the many refinements supplied with the Nettar.

## NETTAR

*Automatically erects itself ready for taking pictures.*

The Nettar is 100 per cent self-erecting; no need to pull down the front. Press the self-opening button and the lens front comes out to the correct position for taking pictures. The Nettar is made in one size, to take  $3\frac{1}{2} \times 2\frac{1}{2}$  roll-film pictures, and with the variety of lenses and shutters vary in price from £3 15 0 with f/6.3 anastigmat and 3-speed Derval shutter to £9 17 6 with Zeiss Tessar f/4.5 and Compur shutter.

12-page folder free. 80-page catalogue 3d. in stamps.

ZEISS IKON LTD., 11, Mortimer House,  
Mortimer Street, London, W.1.

## CONTAX AND LEICA ENTHUSIASTS—BUYING, SELLING OR EXCHANGING— YOU CAN DEAL MORE ADVANTAGEOUSLY WITH THE ONLY FIRM IN GREAT BRITAIN SPECIALIZING EXCLUSIVELY IN MINIATURE PHOTOGRAPHY

WITH EVERY CAMERA WE SELL (NEW OR SECOND-HAND) WE GIVE THE FOLLOWING:

- (1) Pre-sales service. Including absolutely impartial advice on the choice of suitable apparatus and, where desired, comparative prints obtained with various well-known lenses at full aperture.
- (2) After-sales service. Including constructive criticism, advice on results, and advance information of second-hand accessory bargains, etc.
- (3) Special consideration if at any time it is wished to dispose of the apparatus—either for cash or part exchange.

A FEW EXAMPLES OF OUR GUARANTEED SECOND-HAND CAMERAS:

### CONTAXES:

Contax, slow-speeds model, f/2 Sonnar, ever-ready case. As new ..... £28 17 6  
Contax, as above, but improved 1935 model, f/2 Sonnar, ever-ready case. Indistinguishable from new £31 0 0  
Contax, slow-speeds model, f/2.8 Tessar, ever-ready case ..... £22 10 0  
Contax, Model A, 1/25th to 1/1,000th, f/2 Sonnar, ever-ready case ..... £25 0 0  
Contax Model A, 1/25th to 1/1,000th, f/2.8 Tessar, ever-ready case. New condition ..... £19 0 0  
Contax, 8.5-cm. f/2 Sonnar lens. Cost £37 2s. 6d. this year. As new ..... £27 0 0  
Contax Universal View-finder. As new ..... £6 0 0  
Collapsible Lens Hood, £1. Cassettes, each, 8s. 6d.

### LEICAS:

Leica Model II, f/2 Summar, ever-ready case. As new ..... £25 0 0  
Leica Model II, f/3.5 Elmar, ever-ready case. Good condition ..... £17 0 0  
Another, as above, but indistinguishable from new, ..... £18 0 0  
Leica Model II, f/2.5 Hektor, ever-ready case. As new ..... £19 17 6  
Leica Model I, non-interchangeable, case. £7 15 0  
Leica Stereoly Attachment. As new ..... £4 7 6  
Leica f/1.9 Hektor Lens, coupled ..... £17 10 0  
Leica Focomat Enlarger. Stock-soiled only. £13 17 6

EVERY MINIATURE CAMERA OF DISTINCTION IS TO BE SEEN AT OUR PREMISES AT 202, HIGH HOLBORN.

WE WISH TO BUY FOR CASH  
OR TO  
OBTAIN IN PART EXCHANGE:

# THE London Salon of Photography 1935.

**SENDING-IN DAY, Wednesday, September 4th.**

THE TWENTY-SIXTH EXHIBITION promoted by the Members of the London Salon of Photography will be held at The Galleries of the Royal Society of Painters in Water Colours, 5a, Pall Mall East, London, S.W.1, from SATURDAY, 14th September, to 12th October, 1935.

## CONDITIONS OF ENTRY (Please read carefully).

No. 1. Pictures from exhibitors in the British Isles must not be framed; but may be mounted. Each picture must bear on the back, clearly written—(a) name of artist; (b) number and title of picture; corresponding to particulars on the Entry Form.

No. 2. When mounts are employed, they should conform to the following sizes—25×20, 20×16, or 15×12, but no mount to exceed 25×20; and it is suggested that white or light-toned mounts be employed wherever possible.

No. 3. Pictures from abroad must not be mounted (or framed), but should bear full particulars as above.

No. 4. Pictures which are sent unmounted will be suitably mounted by the Salon Committee, and all accepted pictures will be shown under glass.

No. 5. All pictures should be sent by parcels post, packed flat, and properly protected with stiff cardboard and adequate wrappings, addressed to: THE HON. SECRETARY, THE LONDON SALON OF PHOTOGRAPHY, 5A, PALL MALL EAST, LONDON, S.W.1.

No. 6. The sending-in day is Wednesday, September 4th, 1935. All pictures for the Exhibition must arrive at the above address on or before this date. Exhibits may be delivered by hand at the Gallery on this date only.

No. 7. The Entry Form, properly filled in, must be sent with the pictures, together with entry and packing fee of 5/- (this fee covers any number of pictures from one exhibitor).

No. 8. To avoid Customs complications, all entries from without the United Kingdom must be sent by post and without prices marked on the prints. Packages containing such entries should be clearly labelled: "PHOTOGRAPHS FOR EXHIBITION ONLY. NO COMMERCIAL VALUE. TO BE RETURNED TO SENDER."

No. 9. All pictures sent by post will be repacked and returned carriage paid, after the close of the Exhibition.

No. 10. In view of application being made from time to time to The London Salon of Photography for permission to reproduce pictures from the walls of the Gallery, exhibitors are asked to signify on the Entry Form whether they have objection to such permission being given. The copyright, in all cases, remains the property of the authors of the prints.

No. 11. The Committee assure intending exhibitors that the utmost possible care will be taken of all work submitted, but they do not accept any responsibility for loss or damage, either during transit or at the Gallery.

The submission of pictures will be understood to imply acceptance of the above conditions.

Due notification of acceptance of pictures will be sent out as soon as possible.

All correspondence must be addressed to the Hon. Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.

**Readers of  
The Amateur  
Photographer &  
Cinematographer**  
who are preparing  
work for this year's  
Salon may use this

Methods and Ideals of well-known Pictorial Workers.

No. CCXCII.

Mrs.

L. G. KILLBY.

From information communicated to our Special Representative.

"MY husband and I have both been interested in photography for many years, but up till about six years ago contented ourselves with holiday snapshots. Then, one year, having secured some rather successful snapshots (one knows now more by good luck than good management), we decided to have them enlarged. The results were so thrilling that we were spurred on to more serious effort, and fitted up our pantry as a dark-room, and invested in a vertical enlarger.

"The next stage obviously was to have lessons in the use

of the various apparatus and chemicals we had acquired, and also of the camera itself. I was most fortunate in being put in touch with Mr. J. H. Gear, and have been a pupil of his and of his colleague, Mr. B. C. Wickison, ever since. It is to their thorough tuition that I owe any aptitude I may now possess in pictorial photography.

"I use an Etui quarter-plate camera with a film-pack adapter, and also a Rolleiflex, the latter being especially useful when attempting any subject which includes people or animals, depending for its success on their exact attitude or expression. Both these cameras are easily portable, and this is an important consideration when most of one's photography is done on walking holidays at home or abroad, often in mountainous country.

"I generally use panchromatic films, and, when a good cloud effect is present, an  $\times 2$  yellow filter, which I find gives good gradation. After desensitisation I develop with pyro-soda in a dish by inspection, using a time and temperature table as an indication of the normal. I make bromide enlargements on Kodak 'Royal' papers, and develop these in amidol. I think most bromide prints are improved by a little careful touching of the high-lights with Farmer's Reducer, carefully applied with a camel-hair brush after the print is thoroughly fixed, but before washing. After the print is dried I spot carefully with black water-colour and a fine brush, and, if any shadows need strengthening, bring them up by judicious use of stump and charcoal for large areas, and water-colour and fine brush for detail.

"One should certainly aim at getting a negative of the quality that will give a good straight print with the minimum of control, or none at all, but I also feel that the object of pictorial photography is to convey the effect one remembers at the time of exposure, and, provided they are not overdone, I think any retouching processes are legitimate with this end in view.

"My favourite subjects are mountain scenery and old towns and villages, and, if possible, I like to include some human interest. 'The Wheelwright's Shop' was taken in a village in Northern Italy, and it was some time before the wheelwright obliged us by coming into his shop and doing his job. Meanwhile, the camera was on its tripod in the shadows of a barn opposite, waiting for the right moment, and he was quite unconscious of it.

"I find it most helpful to study the opinions and work of others in *The Amateur Photographer*, and also I think it is most stimulating to enter prints for exhibitions and competitions, even if they are not accepted, as thereby one recognises one's own shortcomings in comparison with the higher standards of others."

(A further example of Mrs. Killby's work is reproduced on one of the centre Art pages.)

A DOLOMITE "FORTRESS."

L. G. Killby.

# Pictorial Analysis

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"ILLUSTRATION TO THE RUBAIYAT," by Rutty D. Petit.

THE adaptation of photography for the purpose of illustrating a story—or, as in this instance, a poem—is a thing that calls for a certain amount of contrivance and management that could scarcely be required in almost any other class of work.

Not only has the theme, or a particular incident, to be recorded in the way it is described, but the operator is placed in the position of having to interpret and bring into being the conception of another. How far the photographer has entered into the idea of the poet, and has conveyed, in graphic form, what might be imagined was in his mind, is left to the reader to determine; but, dealing with the subject as a figure study, considerable ingenuity seems to have been devoted to its make-up.

The figure (1) is very well posed, and has, indeed, entered into the spirit of the thing with admirable effect. He, as the prime interest of the subject, acquires force and strength as an item that is asymmetrical in an arrangement that is almost wholly symmetrical. The device is very effective, even if not very frequently employed, and the emphasis it lends is easy to see. The importance of the figure is further stressed by the arrangement of the light and shade, and, in this connection, it will be seen that in his outline is contained the brightest lights of the whole picture, and they, in turn, are displayed against the most powerful darks.

Such a contrast in extremes naturally attracts a great concentration of interest, and, while the figure is placed somewhat nearer the edge than is usual, the position is by no means inclined to weakness, as it is justified by the formal character of the setting.

Moreover, it is countered by the fact that the lower part of the figure extends across the vertical centre, and, in these circumstances, it is permissible

that his head should be placed more off the centre than would be acceptable in the ordinary way. The presence of the bowl on the right (2) and the lamp above (3) also have an influence. They act as supporting accents, and, having regard to the placing of the figure, the introduction of the one demands the inclusion of the

either, but the figure would then have to be brought more into the picture, and it is doubtful either if the theme would be so well sustained or the space appear to be fully furnished. There might easily be a suggestion of emptiness or slightness of material which the inclusion of the items in question avoids, but, with their introduction—and their value as accessories cannot be doubted—it is essential that they shall both balance each other and accord with the figure as well. That they do so is evident from the sense of completeness which the composition conveys, but, in the placing of accents such as these, there is generally room for a not inconsiderable degree of adjustment, and it is interesting to speculate upon the effect that would obtain were they otherwise placed.

Some alternatives have already been indicated, but innumerable re-arrangements are feasible, and, if it be desired to experiment with the picture, it is a fairly simple matter, without spoiling the reproduction, to cover up the two items with black paper, such as is wrapped round sensitive material, so that the remainder of the print is unobscured, and the whole then covered with a piece of glass. Pieces of paper, of a shape and tone to correspond, could be cut out to represent the lamp and bowl, and moved about—first as mentioned above to get the idea, and then to work

out individual fancies.

The experiment, at all events, would lead to an appreciation of the part that balance plays in the construction of a composition, and the principle operates in still life, landscape, portraiture or any other work.

Here, as will be seen, the adjustment of the three items is very nicely calculated, and, though it is doubtful if it could be improved upon, an arrangement that is different but equally effective could possibly be devised.

"MENTOR."

other. If the lamp happened to be first included in its existing position, the necessity for another item in the position of the bowl would become apparent. Similarly, if the bowl were initially incorporated, the need for the lamp would be disclosed, or, were the lamp placed more to the right, the bowl would either have to be raised or put more towards the right-hand side to provide an efficient balance, and vice versa.

It would be possible, of course, for the subject to be treated without

# PICTURES by Novices

## SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page

IT is but seldom, in these columns, that it is possible to advance the suggestion that the viewpoint is too far off. As a general rule, the opposite is the case, and times without number it has been found necessary to recommend a more distant standpoint. The large expanse of foreground in No. 1 of the prints reproduced on the opposite page, however, is an indication that a nearer point of view would be preferable, particularly as the real subject material—the vessel on the left—is rendered on so small a scale.

### Spacing and Layout.

"Southampton Docks," by W. B. Carr, the picture in question, suffers from a plenitude of space. It has too much in it. It is not possible, of course, for the subject to be more closely approached, unless by means of a boat, but it is possible to trim the print so that nothing but what is essential is included.

All that is vital to the picture would be contained in what is left after trimming one inch from the right, three-sixteenths of an inch from the left, and half an inch from the base. The perspective, perhaps, may not be quite the same as would be obtained from a nearer viewpoint, but, for all practical purposes, the end amounts to much the same thing, and, if a larger print is desired, recourse should be made to enlargement.

In the revised arrangement, not only is the layout of the subject improved, but its value is not dissipated nor wasted in too great an expanse of setting. On the other hand, it is preferable that a viewpoint that is too distant should be chosen instead of one that is too near, for, in the former case, it is possible to adjust matters by trimming, and, in the latter, it is impossible to add anything that has not been included in the negative.

No. 5, "Early Morning," by G. W. Cattermole, is somewhat akin in character, and here, again, an impression is conveyed that the subject material is in excess.

### Isolating a Subject.

In the centre there is a group of houses in sunshine, and these are surrounded by others in shadow.

This little portion, together with a modicum of foreground, provides quite a sufficiency of matter for a subject, and has the virtue that its interest is concentrated rather than spread over too wide an area.

The interest of the part is greater than the whole, and, on a casual inspection of the remainder, it seems to be practicable similarly to isolate other bits that would make up equally well.

Technically, the print is good, and there does not appear to be any reason why the piece in question, or any other that might be selected, should not be enlarged to any reasonable size. Alternatively, if a telephoto lens be available, it might be possible to arrange for a similar selection to be made at the time of exposure with the advantage that the subject proper would be included on a larger scale in the negative.

There would be no difference between the results, provided the viewpoint remained the same, whichever method were employed.

### Weight and Scale.

The point to keep in mind, however, is the fact that a subject should have sufficient weight and be of such a scale that it is enabled to hold the attention.

In each of these two cases the interest is lacking because there is so much to attract it, whereas, if some of its elements were taken alone—in the manner that has been suggested—the attraction would be more concentrated because of the greater simplicity of the arrangement and the restriction of the material.

Reference to Nos. 2 and 3, "There's a Wind—," by Harold Jackson, and "Off with the Tide," by Miss Eileen Harding, discloses the value of subject limitation and provides cases in point.

As a matter of fact, the former could do with a little more space for a setting, for there is rather a lack of foreground and a little greater amount above the head would not be disadvantageous. But it must be admitted that, as far as concentration is concerned, there is no doubt about it, and the figure attracts and holds the attention to the exclusion of everything else.

In No. 3, the group of men engaged

in launching the boat is likewise well localised, and unity is no less effectively in evidence.

### Vertical or Horizontal.

The subject, nevertheless, is one that would seem better treated as a horizontal rather than a vertical picture, for some of the space above and below could be dispensed with, and the greater amount on each side would be beneficial.

The tones are a bit inclined towards an excess of contrast, and, *vide* the remarks in these columns on the 17th July, a softer grade of printing paper would be likely to produce a more harmonious rendering.

"Washing-Day" (4), by T. G. Stow, offers an improvement in this respect, but the figure on the left and the group on the right seem to form centres for two different subjects, as will be seen if the left-hand side to an inch and a quarter from the edge be covered up, or the right to the same line. A bit of the foreground would need to be removed in both cases, but for concentration of interest and unity of appeal, either portion makes up better than the whole.

A landscape like No. 6, "Derbyshire Landscape," by J. Dexter, falls into rather a different category. It would, no doubt, be very pleasant to look upon, but it does not, unfortunately, seem open to treatment in such a way as to form an acceptable composition.

### Subject and Arrangement.

The line of the roadway running right across the picture and that of the wall seem to divide the foreground from the distance. There should be a way out or some sort of direct connection between the two, and, if the tree in the centre did not happen to be there, and there were a break in wall at the same point, part of the difficulty would be overcome.

The road itself, however, would remain a drawback, and, possibly, it would have been better to have sought another viewpoint altogether, which, while retaining most of the distance, offered a re-arrangement of the foreground. It may be that a line of sight from a standpoint more to the right and looking down the lane might provide a better composition.

"MENTOR."

# With the Beginners

NOTES AND NOTIONS FOR THE  
LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

## IN THE WOODS.

I LOVE forests, with all their beauty and their infinite variety, and it is my good fortune to live within easy reach of one of the best in England. In this and other forests I have tried to secure pictures by various means, of course including photography, and have fallen far short of satisfying myself with the results.

Obviously, actual colour plays a vastly important part in woodland subjects, and the best results I have secured have been half-plate colour transparencies of autumn effects; but these are expensive, and not easy to exhibit properly. A few attempts at water-colour have humiliated me, although I have friends who work

wonders in this way. So I have been reduced to occasional essays in monochrome photography.

As I see many other photographs of forest subjects I have learned that I am not the only one who fails, as many of the results clearly fall short of doing anything like justice to woodland beauties. They could easily be better. It may help us all, therefore, if I try to set down some of the main causes of failure, as I see them, and to give one or two suggestions as to what may be done to save us from such frequent disappointments.

I took Fig. 1 to illustrate a common cause of shortcoming, and it is a fairly typical example. This bit of birch wood was delightful to the eye, but the part selected is pictorially unsatisfactory. It certainly indicates that there were large numbers of silver birches, and plenty of bracken, but it will not do. The tree trunks run right across the picture space, apparently very much in one plane, which they were not. There is no "arrangement" and no centre of interest. The largest trunk is pushed right to one side, and it does not spring from the ground, but from one edge of the print; the next most important tree is right in the middle, which is just where it ought not to be.

Fig. 2 was taken a few yards away. It suggests the wood much better, although far less is included. The one trunk emphasises the character of the birches, and the clump of bracken at its foot tells its own story. It is clear that this sort of thing

Fig. 1.

is repeated over and over again, and that the part emphasised is a sort of sample. The vertical treatment suggests height better than the horizontal form of Fig. 1.

In Fig. 3 is a sort of note or sketch of a lighting effect. The contrasts were extreme. The block is harsh and misleading, as the print was made for me on a paper much too contrasty. I can make a good print from the

Fig. 2.

Fig. 3.

negative, because I gave an exposure of a second at  $f/11$  on a very fast film, and cut down development. But even a print with proper tone values is not a "picture." A painter might make a rapid sketch to show how that trunk gleamed out against the dark shadows beyond; but he would hardly make a laborious picture of it. The interest is too slight.

I also gave a long exposure to Fig. 4, notwithstanding the brilliant sunlight. A rather small stop was necessary, and a "snapshot" exposure would have been hopeless. In the original there is all the required detail in the tree trunks, and there is a most realistic rendering of a sort of haze of young grass in the slight track. Apart from colour it gives a good idea of what I saw, and again it will be seen that I have used only a very limited amount of material.

The old saying that "you cannot see the wood for the trees" has a bearing here. We are inclined to show too much of the spacious woods, instead of suggesting them. It is easy to conclude from Fig. 4 that the path, with its fringe of bracken, extends beyond the limits shown, and that there are other paths and other trees elsewhere. If we select many other similar "bits," and look at them one

Fig. 4.

after the other, we shall gradually build up some sort of idea of what the forest has to show us. But does not a mere glance at Fig. 4 alone convey a strong hint that I was wandering

in a sweet and pleasant place?

A sore trial to the forest photographer is "spottiness." In many cases there appear innumerable spots and patches where the sky shows through the foliage; and when there is sunlight, as there so often should be for forest subjects, there are multitudinous high-lights on leaves, ferns and grass. Fig. 1 shows the former trouble, and Fig. 3 the latter. Some of these lights are essential parts of the subject; but others may be a mere irritation.

It is often an easy matter to print in a sky, and it is pleasant to see peeps of clouds through the trees, whereas it is quite the reverse to see blank paper. Many irritating spots, especially about the edges and corners, can be toned down by careful work on the print, and some must be eliminated altogether. But the work must not show; obvious pigment is as bad as obvious blank paper.

I think that our best chances in the woods lie in selection—in isolating "samples" rather than trying to deal with general views. Fine pictures can be made in forests, and there is no reason why we should give up trying to make them just because the task is difficult. What man has done, man can do. W. L. F. W.

## Letters to the Editor

*The Editor is not responsible for the opinions of his correspondents.*

### CAMERA MOVEMENT DURING EXPOSURE.

SIR,—May I be allowed a little space in your much-valued paper to criticise Mr. Dickinson's article on the above?

Camera movement during exposure may be: (1) Lateral movement of the whole camera at right angles to the lens axis, measurable by the distance displaced; or (2) rotation of the rear of the camera, horizontally or vertically, the lens remaining fixed, measurable in degrees; or (3) rotation of the lens, the

centre of the negative remaining fixed, measurable in degrees; or, of course, a combination of these movements. For the present discussion (2) and (3) may be taken as being alike.

Now Mr. Dickinson cannot refer to (1) as in his sketches the position of the lens remains fixed, so we may take it he refers to (2) [or (3)]. In this case it is seen on reference to the figures that the short-focus lens is rotated approximately  $14^\circ$ , while

the long-focus lens is rotated approximately  $6^\circ$ , yet he suggests that the "movement" is the same. I submit that the sketch herewith is a truer presentation of the facts. The black rectangles represent the two cameras with their lenses L in a common position. Now if the cameras are both moved, either laterally or rotatively, the images  $V_1$  and  $V_2$  move on their respective negatives, a distance proportionate to the focal length of their lenses, i.e., the image is displaced more by the long-focus lens.

It can easily be seen that when the two pictures are enlarged to the same size, the same amount of displacement will be evident.—Yours, etc.,

FRED. F. MESSHAM.

### CIRCLE OF CONFUSION.

SIR,—I quite agree with all Mr. Sowerby says in your issue of the 12th June concerning the "K" value, but I contend that this aspect of the subject is another stage forward in it, assuming my article to be elementary, as was my intention. Combining his data and mine would have defeated the object I had in view entirely. This object was to help the embryo technician to understand depth of focus and finally to make up a table, which can be so useful, but based upon a circle of confusion no larger than  $1/5000$  in., and not as given in many textbooks.

Mr. Sowerby states that I have "chosen  $1/5000$ " as a universal standard of definition—but I made it quite clear that "no larger fraction than  $1/5000$  can be taken, etc., etc." which is quite different, and is what I still stoutly maintain after many actual experiments. I have not adopted or propounded any "standard" which would be absurd.—Yours, etc.,

H. B. COLBOURNE.

# Picture Points

## for Beginners by RICARDO

### Lighting for Still-Life

WHEN choosing the lighting for still-life subjects, artificial light has much to be said in its favour, particularly because of its constancy and its convenience in being movable to suit the subject. But artificial lighting needs to be used with discretion. One major source of light should always be aimed for, while the secondary and weaker light should be used to give relief or "modelling" to the shadows. The first sketch shows the effect of two sources of light of equal power placed at an equal distance on either side of the subject. The effect is to divide the interest. The eye, which is always more attracted by high-lights than by shadows, wavers between the two sides of the subject matter. Place one finger over the right side of the bowl, and then remove it, to see this effect.

Another bad fault of this arrangement is the awkward position of the apple on the table. Notice how it just touches the bowl and the edge of the table, and then compare it with the second picture. It is weak composition to let objects just, or nearly, touch. Let them definitely break into the next article, or keep

them comfortably away. Compare the foregrounds, too. Try and avoid anything with creases and folds in it, as they always attract unnecessary attention.

The reverse side of wallpaper often makes a good substitute for a base and background.

### Leading into the Picture— with Variations

IN last week's series of "Picture Points," under the title of "Leading into the Picture," we dealt with the principle of allowing space

in front of objects leading into the picture, particularly if they are apparently moving fast.

The first of these two sketches, with the boat in the top right-hand corner, which is, pictorially, well placed, makes quite a pleasing picture. This conforms to the practice of leaving plenty of space ahead of the object and preventing it from running out of the picture. But, like many of the so-called "laws" of composition, it can be modified by other factors in the picture.

In the second sketch we have purposely placed the boat in the bottom corner and made the exception to the rule. But another *motif* has now taken priority of place, and that is the wash created by the boat. The definite lines of the wash now dominate the picture, while the boat becomes of secondary interest.

Whenever subjects like this are available a "diagonal" composition, as shown, is generally far more pleasing than either a vertical or horizontal scheme. This means anticipating the path of the subject and getting to one side, and not immediately over it. If the subject is moving rapidly, accurate placing will be ensured by following it with the camera while the exposure is being made.

### Repetition—Monotonous and Varied

IF one examines the composition of well-known masterpieces, whether they be paintings or photographs, one is almost sure to find the presence of repetition.

This may occur in the nature of repeated masses or shapes, lines or tones. But the repetition is always varied and never exactly the same.

In the sketch below, showing the four ships in a line, we have repetition in its most uninteresting form. It is monotonous. The ships are placed

equidistant from each other, immediately dividing the interest and losing all pictorial value.

Now study the second sketch on the right. We have repetition again, but in a more subtle form. There are two reasons why there are three boats on the right-hand side. The first is that two boats, from the same viewpoint, would not balance the "tone" weight of the two larger ships on the left, the second is, because three is a pleasing variation to two, and that is the idea underlying the art of repetition and grouping. Notice, too, how the tones in the sails are varied, showing that repetition of tone values should also be considered. Later on, we will examine some more forms of repetition, which can occur in, and strengthen, all forms and styles of photographic composition.

# Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

## Your Holiday Film By P. H. BRAITHWAITE.

**H**OLIDAYS naturally inspire the ciné enthusiast to make the fullest use of his camera; the freshness of scene and unusual daily routine giving him ample opportunity for making his holiday film.

The over-enthusiastic amateur may tend to be too eager to shoot anything and everything he sees new to him, resulting in more or less indifferent viewpoints and photography being recorded. The selection of subjects should be undertaken with care to enable the best viewpoint being obtained in relation to existing lighting. It must be remembered that a ciné camera, despite its simplicity in operation, cannot produce more than is put into it. Being essentially a mechanical means of reproduction, cinematography demands both inventive and artistic skill to bring out its best capabilities. As your holiday film will be one of future happy memories, extra care expended on it will be amply repaid.

### Outdoors.

As to choice of outdoor subjects, this naturally depends upon individual taste. Quite frequently it is the most simple events in the course of the day's ramble which yields the best film. Sea bursting upon a group of rocks, a subject simple enough in itself, can picture in a short length of film a wonderful and beautiful expression of strength. Whatever the subject, always seize movement. Should the principal subject being filmed be stationary, arrange the viewpoint to include outside movement—a near-by tree having its leaves rustling in the breeze or a suitable moving character included in the shot.

### Seaside Reminders.

If at the seaside remember that, owing to the absence of smoky haze, the best possible lighting conditions are available, rich in actinic quality and so useful photographically. On a brilliant day there will probably be a tendency to over-expose, and the lens must be suitably stopped down to compensate for it. Besides the usual family shots on the beach, numerous excellent material is always available on the coast—fishing smacks and similar craft, shots on the pier and children bathing. Care should be exercised that the sun's reflection on the water does not shine directly into the camera lens. Always cap the lens and replace the camera in its case in between filming.

If the holidays are being spent by the riverside, many beautiful compositions can be secured. During one of those outings in a punt or launch, unusual and pleasing shots can be taken as the boat slowly threads its way along. Approaching bridges, locks, or a riverside church, are often worthy of a short length of film. Even foliage, throwing its reflection on the water, allows the cinematographer to exert his efforts in pictorial balance and composition. Harmony of masses of light and shade afford ample opportunity of expression. There is always movement and life on or near a river, be it passing craft or the graceful swans.

### In the Country.

For those who have chosen the country there are many varied and interesting subjects. Each country town and village has its own peculiarities. Most of them boast some thatched cottages. Some of these have been allowed to fall into decay whilst others appear to

have had their charm destroyed by rebuilding. By including suitable figures those unspoilt can be faithfully recorded. Village customs still prevail, so do many of the historic inns, smithies and churches, and they are all excellent material for the ciné camera. Whatever the subject being filmed, include a few close-ups to sustain interest in the finished film. Remember that close-ups and medium shots should be well lighted, as the nearer the object and lens become so the volume of light diminishes between them. On the other hand very distant shots will require the lens diaphragm to be stopped down to secure good rendering. This is necessary, partly on account of the tendency to over-expose such subjects and partly to ensure perfection of detail.

Whether the holidays are spent in the country, by the sea or the river, there is ample scope for the amateur to construct his holiday film, which, when screened later on, will enable him to look back with pleasure on the happy days spent during his vacation.

*At a popular seaside resort on Bank Holiday. Many interesting action-subjects are available to the ciné worker who undertakes to make a film dealing with different phases of holiday life.*

# Film our Vanishing Villages

By  
M. A. LOVELL-BURGESS.

THERE are country villages but a few miles from London which retain all their ancient characteristics and yet must obviously be absorbed into Greater London in a short time.

I have such a village in mind as I write. It is a village which has existed since Domesday, and which is even now passing away. What a subject for the amateur cinematographer! What a possible record of history! Amateur cinematographers have given us days in the life of great cities and industrial towns, but how much more important it is to remember, in that immortalised sunlight and shadow which we call photography, our little English villages.

One single family, generation after generation since Elizabethan days, has owned the village forge. They have a tradition how one of them saw King Charles II, and members of his court, ride by one bright morning on their way to London, and the King had a long white feather in his hat. (That story was told long before ever the tourists came!) But take those shots of the old forge as quickly as you can,

because few horses come now to the forge, although its doors open to let forth industrious, metallic sounds as early as six o'clock these summer mornings. There is a lorry parked in the yard, and soon there will be petrol pumps.

As yet there are no trains to this village from which, on bright mornings, the Crystal Palace is visible, but airplanes from the near-by aerodrome go trekking over all day, and at night jewel the sky; expensive cars, like shining beetles, descend the valley road to the new golf course, and the London Transport buses are crowded with young people over the week-end. The lanes are thronged then with cyclists and hikers, most of the girls wearing shorts. The ancient church is a rendezvous for the campers after ten o'clock on Saturday evenings. Seated on the low wall of the graveyard, used for burials for over eight hundred years, young people with accordions sing cheerfully about life being a song, while staid villagers lean over their cottage gates to watch them.

Such old cottages they are, too, soon to be pulled down to make way for modern

residences, which will be erected directly modern sanitation is achieved—a matter of some two or three years' time, I am told. And soon there will be electric trains.

On one of the few remaining farms the hay came home on lorries this year. Gipsies rent the farmhouse at the top of the village, beyond the duckpond, at £1 a week. They go to the near-by fairs in their car. Not far away is the ornate tombstone erected in memory of Urania Boswell, that queen of the gipsies, known as "Gipsy Lee." On it I read the words "Home at last."

Wouldn't the Americans love a film like this? Only they probably wouldn't believe it genuine. It's the meeting-place of the old and the new, this village; a place of amazing contrasts, full of movement and action. Here, for a short space, history is being made, and because the new must win, as it always does, history is also being lost. For the sake of the generations to come, and that sense of continuity which is as precious to a country's culture as it is to a film, take your ciné camera, and, while there is yet time, gather in rich plunder.

## ACTION SUBJECTS for the AMATEUR CINEMATOGRAPHER

*The Amateur Photographer and Cinematographer's Diary of Forthcoming Events.*

### FORTHCOMING EVENTS DURING AUGUST, 1935.

DATE.	EVENT.	PLACE.	DATE.	EVENT.	PLACE.
Aug. 2.	Goodwood Race Week Ends ..	Goodwood.	Aug. 12-14.	Pleasure Fair .. .. .	Mitcham.

				West Somerset Polo Tournament .. .. .	Minehead.

# "The A.P." Monthly Competitions

## PRIZES AND RULES.

To encourage pictorial outlook and good technique in the photographic work of our readers in all parts of the world.

### (I) For Advanced Workers.

This class is open to all amateur photographers.  
**FIRST PRIZE.**—One guinea in cash or "A.P." silver plaque (optional).

**SECOND PRIZE.**—Half a guinea in cash or "A.P." bronze plaque (optional).

**THIRD PRIZE.**—Five shillings in cash.  
A special prize of five shillings in cash for the best mounted picture.

#### CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) All prints must be accompanied by a stamped addressed envelope or wrapper if they are to be returned. Prints receiving an award will be retained.

(2) Prints must be mounted, but not framed.

(3) Returnable prints in the Advanced Section will be sent back with a typed criticism, and classified according to merit.

(4) Prints may be of any size and by any process, and must be the competitor's own work throughout.

(5) The award of a prize or certificate in the Advanced Workers' Competition or any other competition or exhibition will not debar the competitor from entering again on future occasions and winning further prizes.

### (II) For Intermediate Workers.

This class is to encourage those readers who have passed the "beginner" stage and may have won an award in the Beginners' Competition, but have not progressed sufficiently to enter in the Advanced Competition.

**FIRST PRIZE.**—Half a guinea in cash.

**SECOND PRIZE.**—Five shillings in cash.

#### CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) No print must be larger than 10x8 in., and can be by contact or enlargement by any process, and may be mounted.

(2) The whole of the work (exposure, development, printing, etc.) must be carried out by the competitor.

(3) Prints entered in the Intermediate Section will be criticised and returned if accompanied by stamped addressed envelope or wrapper. Prints receiving an award will be retained.

(4) The award of a prize or certificate in the Intermediate Competition debars the competitor from entering this competition again, but he is then eligible for the Advanced Workers' Section.

### (III) For Beginners.

This class is open to those who have never won an award in any photographic competition or exhibition.

**FIRST PRIZE.**—Half a guinea in cash.

**SECOND PRIZE.**—Five shillings in cash.

#### CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) No print must be larger than 6x4 in. Contact prints or small enlargements up to this size are eligible, but must be unmounted.

(2) The exposure must have been made by the competitor, but developing and printing may be the work of others.

(3) No prints can be criticised or returned.

(4) The award of a prize or certificate in the Beginners' Competition debars the competitor from entering this section again.

### General Rules.

(1) Any number of prints may be entered, but each print must have on the back the appropriate coupon

(see advertisement pages) the date of which must be within five weeks of the closing date of the competition. Overseas readers may use the most recent coupons to hand.

(2) Each print must have on the back the name and address of the competitor, and the title.

(3) All entries must be addressed to The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the package must be marked on the outside "Beginners," "Intermediate," or "Advanced," as the case may be.

(4) No packages will be received on which there are postage charges to be paid.

(5) No communications on other matters should be enclosed with competition prints. No correspondence in connection with the competitions can be undertaken.

(6) The entry of a print will be regarded as a declaration that it is eligible under the rules, and that the competitor agrees thereto.

(7) No responsibility is taken for the safety of prints, and the Editor's decision on all points connected with the competitions is final.

(8) The publishers of *The Amateur Photographer* shall have the right to reproduce, without payment, any print entered, or to allow its reproduction in any other paper quoting from *The Amateur Photographer*.

(9) The closing date of each competition is the last weekday of the month. Prints arriving late will be entered for the next month's competition.

(10) The cash prizes awarded in these competitions are despatched on the fifteenth of the month following the announcement of the awards.

The closing date for the August competition is Saturday, August 31st.

## AWARDS FOR JUNE.

The prints not receiving awards have been grouped, those in the first group receiving Honourable Mention. The others have been marked Class 1, Class 2 and Class 3 respectively.

Those awarded Honourable Mention are as follows: (2) Yahya Arif (Cairo); A. V. Bibbings (Newton Abbot); (3) Miss Ida Brandon (Bedford); F. Annis Burrows (Chalfont St. Peter); Wm. Clarke (Dunfermline); B. L. Critchley (Bristol); B. K. Dilwali (Simla); Ernest A. Fordham (West Wickham); R. A. Gilzean (Natal, S. Africa); John Henderson (Cambuslang); Ward Hutchinson (London, S.W.); Wm. Jackson (Hull); F. G. James (Wanstead, E.); Dr. S. D. Joughar (Byers Green); E. F. Laevaert (Brussels); Dr. I. Magdi (London, N.W.); C. D. Notley (London, S.W.); (2) Major D. J. Steevens (Bordon, Hants); Kwa Siew Tee (Singapore); Will Taylor (Walsall); R. E. Townsend (Newton Abbot); K. M. Trathen (Redruth); (2) A. R. Turpin (London, N.W.).

### INTERMEDIATE SECTION.

**First Prize.**—"Control," by T. C. Parry, 49, Water Lane, Preston, Lancs.

**Second Prize.**—"Repetition," by J. C. Pretty, George Hotel, Walney Island, Barrow-in-Furness.

**Certificates of Merit.**—"On the Starboard 'Tack'," by C. Gordon Bennett, 8, Maryville Park, Balmoral, Belfast; "The Angler," by Albert Chapman, 1, Southville, Gordon Road, Cheltenham; "The Metal Market, Fez," by R. Cook, Chapel Road, Fulwood, Preston, Lancs; "Daydreams," by A. Pitman, 37, Grasmere Avenue, Acton, London, W.3.

### BEGINNERS' SECTION.

**First Prize.**—"A Summer Gale," by Capt. J. B. Wilson, R.E., 23, Ashdown Terrace, Tidworth, Hants.

**Second Prize.**—"It is still raining, Mummy!" by J. H. Pemberton, 46, Danesbury Road, Bolton.

**Certificates of Merit.**—"Chimes and Tones," by A. W. C. Bonfield, 41, Charlwood Street, London, S.W.1; "Ruth," by C. D. Hunter, Lawnswood, Buckingham Way, Wallington, Surrey; "Kent," by J. W. Walters, 103, Acacia Road, Wagon Green, London, N.22; "Sea Urchins," by R. Gordon Wilson, 25, Colchester Drive, Pinner, Middx.

THE June competitions attracted a particularly large entry in all sections. In the Advanced Workers' Section the use of panchromatic material for picture-making appears to be very definitely established, and the majority of the entries give evidence in their tonal qualities of the intelligent use of this material. In both the Intermediate and the Beginners' Sections the quality of the prints generally are also very satisfactory. The awards are as follows:—

### ADVANCED WORKERS' SECTION.

**First Prize.**—"The Flying Age," by Dr. I. Magdi, 26, Oak Tree Dell, London, N.W.9.

**Second Prize.**—"Central Park Lake," by Edward Alenius, 159-18-84 Road, Jamaica, N.Y.

**Third Prize.**—"The Potter," by B. K. Dilwali, 34, The Mall, Simla, India.

**Mounting Prize.**—"Over the Hills," by Denis Whitlock, 44, Scotts Lane, Shortlands, Kent.

**Certificates of Merit.**—"Portrait of a Young Man," by Yahya Arif, 8, Rue Ismail Pacha, Garden City, Cairo, Egypt; "Begum Joughar," by Dr. S. D. Joughar, Byers Green, Co. Durham; "Thames Sunset," by K. M. Trathen, Mount Carbis, Redruth, Cornwall.

## The Week's Meetings

Wednesday, July 31st.

Plymouth I.P.S. Bickleigh Vale.  
Stockport P.S. "True Pictorialism." F. C. Tilney.  
Worthing C.C. Finton to Patching.

Thursday, August 1st.

Hammersmith H.H.P.S. "The Camera for Landscape." J. Ainger Hall.  
N. Middlesex P.S. Competitions. Prints. Members' Queries.

Friday, August 2nd.

Leigh Lit. Society (P.S.). Open Meeting.

Saturday, August 3rd.

Sheffield P.S. Bakewell and District.  
Stockport P.S. Chew Valley.  
Walthamstow and D.P.S. Abridge.

Monday, August 5th.

N. Middlesex P.S. Hitchin.  
Oldham E.P.S. Slide and Tinting.

Tuesday, August 6th.

Nelson C.C. After-work on Enlargements.

Wednesday, August 7th.

Rochdale P.S. Suggestions for Winter Syllabus.

## A COMPETITION SPECIALLY FOR NOVICES

### SUBJECTS.

Prizes will be awarded for the best snapshots of family groups or single figures taken at home or on holiday, indoors or outdoors. The arrangement of the groups or the pose of the figures is left entirely to the discretion of the competitor.

The competition is open only to novices: those who have never won an award of any description in a photographic competition.

Entries are restricted to contact prints. The smallness of the prints, which may be mounted if necessary, will not affect their careful consideration in this competition.

### PRIZES.

The prizes will consist of supplies of roll film or of plates (if any winner happens to use a plate camera).

THE FIRST PRIZE WILL BE TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.

THE SECOND PRIZE WILL BE TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.

THE THIRD PRIZE WILL BE ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.

TWELVE PRIZES OF ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

The winners of these prizes will thus be encouraged to continue their photographic activities throughout the year with a supply of free film.

RULES WILL BE GIVEN AGAIN IN NEXT ISSUE.

# Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

## Faulty Film.

I developed the enclosed length of film by hand. What has caused the clear patches along the edges? Can I remedy them? S. W. (Catford.)

The clear parts on your film have not been developed, and, of course, nothing can be done to remedy it. You say nothing about having passed the film through water first, and if you did not do this it would be quite possible for the film in parts to remain dry if not properly submerged in the developer. It is evident that you only developed for a short time, as the negatives are so very thin.

## Uneven Definition.

Why is part of the enclosed negative out of focus? Is it because the lens is not too good? J. S. G. (Stornoway.)

It is a pity that your negative is so badly over-developed that it is difficult to study it. The definition of your photograph is exceedingly good on the right, but falls off towards the left. It is not at all likely that there is anything wrong with the lens, nor is it possible to say definitely why the definition is not equally good everywhere. It is quite likely, however, that the trouble is due to the front not being rigid, and parallel with the film when the exposure was made.

## Oil Process.

Where can I get a book on oil and bromoil printing? D. S. K. (Glasgow.)

We should advise you to write to the Autotype Co., Ltd., of 59, New Oxford Street, London, W.C.1, asking them to let you know what books they now have available dealing with the processes you name. A dealer could also get for you "N.P. Handbook No. 3," by C. J. Symes (rs.); or "Bromoil and Transfer," by Leonard Gabriel (7s. 6d.). A more advanced work is "Pigment Printing," by G. L. Hawkins (2rs.).

## Grey Prints.

I send a negative, and an enlargement on contrasty bromide. Why are my prints so grey? F. H. (Blackburn.)

The negative you send is quite hopeless for making an enlargement with good tones on any paper. It is probably under-exposed, and it is certainly grossly under-developed, and fogged all over. You are evidently quite at sea as to the procedure for producing a good negative. Once you are able to do this you will have no trouble about making good prints. Look after the exposure, protect the negatives from light during development, and develop long enough to get sufficient strength to avoid the necessity for using a contrasty paper.

## Pictorial Photography.

Could you tell me of a book on making a photograph in the pictorial as opposed to the processing sense? R. S. (Farnborough.)

There are many books in which an attempt has been made to throw some light on to the very wide and complicated subject to which you refer. We know of several such books, but we hesitate to recommend specially any one of them. Pictorial photography cannot be reduced to rules, nor taught in a series of lessons, as you are no doubt well aware, and it is our honest opinion that you cannot get better guidance in this matter than by a weekly study of the photograph to which a page of criticism is devoted in our columns every week. The cumulative effect of this study is certainly very valuable, and the author of the criticism is himself one of our foremost pictorialists.

## Infra-red Films.

Do you know of any infra-red cut films in 9x12 cm. size? M. P. K. (Edgware.)

We have what we believe to be a complete list of infra-red material, and this contains no cut films.

## Price of Lenses.

I have been offered two lenses by the same maker, and of the same aperture, but one costs £4 more than the other. In what respects will the cheaper lens fall short of the other, and to what extent? E. W. S. (Glasgow.)

We are quite unable to state wherein lies the difference between two unnamed lenses. You may be quite sure, however, that there are differences, although it is quite likely that these would not be apparent in ordinary amateur photography. Some of the characteristics of expensive lenses are only of real value in special work. The mere aperture of a lens is no criterion of value.

## Fixing in Tank.

Can you recommend a tank in which films can be fixed and washed as well as developed? F. E. K. (Shirley.)

As far as we know, any tank on the market can be used for fixing as well as developing. That is to say, it is mechanically possible. The reason why this is not generally recommended is that the fixing solution tends to damage the metal of the tank, and it is often no easy matter to cleanse the tank thoroughly afterwards. It is quite simple to wash the film in the tank after development, and then transfer it to a suitable vessel containing the fixing solution.

## "Black" Negatives.

Why have the negatives (sample enclosed) turned out black even at the edges? M. F. (Holloway.)

We are quite at a loss to know what you mean by the black edges to your film. The whole film is certainly fogged all over, probably on account of the use of a light that is unsafe for so fast a film, when developing by the dish method. The film, too, is one which requires rather longer development than you have given, and you must remember also that the film is of the matt variety, and does not look as transparent as an ordinary film. It would be quite possible to obtain a good print or enlargement from the negative, in spite of its slight faults.

## Replacing Lens.

Can I take the lens off my camera and replace it by another of the same focal length? J. T. E. (Burnley.)

It is quite impossible to say whether any other lens could be fitted to your camera, even if it was nominally of the same focal length. You give no information whatever as to the character of your camera, or whether it has a focussing scale and so on. Speaking generally, it is not an easy matter to remove a lens from some types of camera and put another one in its place without giving rise to one or more difficulties. On the other hand, there is considerable scope for interchange of lenses with a reflex camera.

## Luminous Watch.

Is it possible to time the development of panchromatic film by means of a watch with a luminous dial? R. C. (Flint.)

The luminous dial would not do any damage unless you brought it very near to the film, and there is, of course, no reason why this should be done at all.

**TIME ALONE WILL TELL !!****The OMBRUX & BLENDUX  
Photo-Electric Meters**

have now been before the public for the past two years, during which time many, many thousands have been sold and are in daily use the world over, and to-day they are, without doubt, the most popular.

*They are acknowledged by all, as :*

- The best Photo-Electric Meter.
- Relatively robust in Construction
- Double Sensitive.
- Fitted with a Lens to control the angle of view to that of the taking lens.
- Smallest and most portable, and convenient in use.

## Let the **Rolleiflex** "MAKE" YOUR HOLIDAY PICTURES

Holidays! What a variety of subjects to be taken—what an important factor it is that you get each picture right. You know how disappointing it can be to find that photographs, which you have no other chance to take, have not come out as you expected.

With the Rolleiflex you are sure of perfect results always by seeing the picture on the ground-glass screen, actual size and right way up BEFORE taking. The automatic speed and lens stop adjustments, film wind and single lever Compur shutter, are features which make the Rolleiflex the most easily manipulated of miniature reflex cameras. The fine-quality lens takes 12 ideal pictures  $2\frac{1}{2} \times 2\frac{1}{2}$  on an 8-exposure  $3\frac{1}{2} \times 2\frac{1}{2}$  roll film for 1/-. With Zeiss Tessar f/3.5 lens and Compur shutter speeded to 1/500th sec., also Time and Bulb..... **£22:10:0**

or nine monthly payments of 52/6.

Good exchange allowance on your used apparatus.

### Displayed Advertisements

Communications on Advertisement matters should be addressed: The Advertisement Manager, "The Amateur Photographer and Cinematographer," Dorset House, Stamford Street, London, S.E.1. Copy for displayed advertisements for the issue of any particular week must reach Dorset House by the first post on Tuesday morning in the week previous. Rates and conditions will be sent upon application.

### Prepaid Advertisements

#### SALE AND EXCHANGE: AMATEURS ONLY—

12 words or less ..... 1/-  
1d. for every additional word.

#### PROFESSIONAL AND TRADE:—

12 words or less ..... 2/6  
2d. for every additional word.

Each paragraph is charged separately.

**SERIES DISCOUNTS** are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid and posted to arrive at the Head Office, Dorset House, Stamford Street, S.E.1, not later than first post FRIDAY for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 26a, Renfield Street, Glasgow, G.2.

## IMPORTANT NOTICE

Owing to the August Bank Holiday, the next issue of "THE AMATEUR PHOTOGRAPHER AND CINEMATOPHIL" (dated August 7th) must be closed for press earlier than usual.

In accordance with the notice that appeared last week, the latest date upon which MISCELLANEOUS ADVERTISEMENTS can be accepted for the above issue is

FIRST POST, THURSDAY, AUGUST 1st.

## WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

## CAMERAS AND LENSES

**Z** ODEL 3½×2½ Plate, f/4.5 lens, Compur shutter, case, slides, F.P.A., Zeiss Mirax enlarging attachment; all good condition, £4/10.—Lees, 24, Burlington Avenue, Oldham. [8515]

4. BRITISH MADE.

### What a customer says:

"Many thanks for prompt dispatch of the 'Avo' Meter. I have now tried this and am definitely keeping same. It is certainly superior to other meters costing considerably more. I enclose herewith cheque—having deducted the allowance quoted on my old meter, which, by the way, I consider very generous. (Signed) Dr. —"

(Original may be seen.)

See what your unwanted meter is worth. Let us make you a SUPER ALLOWANCE.

### DEALERS & PROFESSIONALS PLEASE NOTE!

We supply the "Avo" at full trade terms, immediate delivery.

### POST THIS TO-DAY.

Please send me full details of the 'Avo' Exposure Meter, in which I am interested. Also please quote me, without any obligation on my part, your highest Super Allowance on my present meter, which is a

(Facing West Hampstead Met. Station). Phone: MAIda 7902.

**NON-FLEX SHUTTER RELEASE**

The position of the release on shutters fitted to many hand cameras is inconvenient when using the camera at eye-level. The Non-Flex Shutter Release permits of the shutter being released by the forefinger when the camera is held at eye-level, thus ensuring steadiness and obviating the danger of moving the camera.

For all cameras with between-lens shutters **PRICE 1/6**

## READ WHAT A HIGHLY SATISFIED LONDON CUSTOMER SAYS!!!

London.  
July 13th, 1935.  
"Dear Sirs,—Thank you for the f/2.9 Miniature Camera, which arrived quite safely last Monday. I have not written before, as I wished to test it out first. I have now exposed a full spool, developed and enlarged the results to 10×8 and am delighted with the prints. Considering all these test shots were made at the full aperture of f/2.9, the definition of the lens is excellent. I was doubtful about fogging with the method of loading and unloading, but, however, the Super Sensitive Pan. film shows no trace of fog.  
"In conclusion, I should like to say how satisfied I am with your exchange deal methods, particularly as we are 200 miles apart.  
"Yours faithfully, L. E."

Original of above can be seen at our stores on request.

We are also stockists for the Rolleicord,  
Rolleiflex, Super Ikonta, Ikoflex, Exakta,  
Dekko, Pathé, Leica, etc., etc., etc.

WRITE FOR SPECIAL CLEARING LIST, NOW  
READY.

And we also offer you a selection of Super  
Bargains for cash—see Cameras and Lenses  
Column in this issue.

# IN BATH THIS WEEK

AND UNTIL AUGUST 7th.

Exhibition of Dr. Paul Wolff's Leica  
Pictures at the Pump Room (immediately  
behind our Cheap Street premises).

Talks on "Practical Leica Photography,"  
illustrated with slides, will be given by  
Mr. B. MacAlpine, B.Sc., on Thursday,  
August 1st, at 8 p.m., and Saturday,  
August 3rd, at 5.30 and 8 p.m.

We are showing the full range of Leica  
apparatus, and our Leica expert will be  
in attendance to explain any point in  
connection with Leica Photography.

We offer specially generous allowances  
for cameras in part exchange for new  
Leica apparatus during the exhibition,  
and are officially recommended by  
the makers of the Leica for all Leica  
processing.

# Optochrom Automat

## DAYLIGHT-LOADING

## ROLL-FILM DEVELOPING TANK

A MASTERPIECE OF PHOTOGRAPHIC APPARATUS."

Canonbury, N.5.

March 21st, 1935.

"I think I may say that no single purchase has ever given me so  
much absolute satisfaction as has this 'Automat' Tank. During a  
brief week-end in London I developed four spools in the tank with  
excellent results in each case, and it was a sheer delight to make use  
of such an efficient method of finally washing the developed film. I  
have used several different tanks in the past, but I consider the 'Auto-  
mat' a masterpiece."  
C. E. B. ISHERWOOD.

Withdrawing paper, leaving film in tank.

PRICE, to take 2½ in.×2½ in. or 2½×3½ in. roll **35/-**  
film .....  
Optochrom Thermometer (Fahrenheit) ..... 2/6  
Optochrom Developing Powders, per 1-doz. .... 1/6  
Optochromal Fine-grain Developing Solution ..... 2/-

Ask your dealer to show you an Optochrom Tank.

# HAND CAMERAS

By R. Child Bayley

THIRD EDITION

An outstanding feature of this book, which makes a special appeal to all amateur photographers, is a number of separately printed plates, all from hand camera negatives by the author. These are selected to show the very wide range of subjects accessible to the snapshotter, from pure landscape to telephoto-graphic portraiture.

Though primarily written for the beginner, "Hand Cameras" contains much of interest to the advanced worker, and should be in the working library of all who would attain to the highest degree of artistic excellence in their work.

## THIRTEENTH EDITION

# WALL'S DICTIONARY of PHOTOGRAPHY

AND REFERENCE BOOK  
FOR THE AMATEUR  
AND PROFESSIONAL  
PHOTOGRAPHER

Edited and largely re-written by  
F. J. MORTIMER, Hon. F.R.P.S.

All the latest photographic principles are incorporated in the present edition, which includes up-to-date information on such recent developments as infra-red, high-speed and colour photography. The volume provides practical information in dictionary form on every phase of the subject—technical, pictorial, scientific and general, and is in itself an explanatory index to all terms, formulæ, etc. Its contents are made readily accessible by the extensive use of cross references.

## THIS LEICA USER SAYS —

REMOVING THE ELEMENT OF CHANCE—The Weston Leicameter is specially designed for Leica camera users. All you have to do is to point your Weston to the subject and rotate the dial to agree with the meter reading. Your correct shutter speed and stop number is then shown. The speeds and stops shown on the meter are those actually marked on the Leica camera, no calculating whatever. Meter compensates for all kinds of film and for artificial and natural light—no element of chance or risk (the Weston has MEASURED your exposure). The film speeds are in Scheiner degrees, avoiding reference to film-speed tables. Remove the element of chance by using a Weston Leicameter.

PRICE REDUCTION. Weston Leicameter now only £7 cash, or on easy payments, 16/4 monthly.

# "NADIR" TAPE

REG. T.M.

A glass clear and colourless gummed strip of extraordinary strength, adheres to smooth and rough surfaces without moistening.

Reprinted from "The Amateur Photographer" January 23rd, 1935.

"NADIR" TAPE IS IDEAL FOR REPAIRING TORN MANUSCRIPTS, ETC.

PATENTED

"We have frequently advised a coat of celluloid varnish to protect labels on bottles. Our attention has now been drawn to Nadir Tape, which we find to be a most convenient and effective substitute. It is a perfectly colourless material which adheres at once to any surface without moistening, and has many other uses, such as repairing, mounting and joining up prints and drawings. It is practically invisible. Suitable holders are provided for which refills can be obtained. As an example of price, a reel of 11 yards one inch wide costs 2s. 8d. Nadir Tape can be obtained through stationers, or direct from the Ozalid Co., Ltd., 1, Central Buildings, Westminster, S.W.1. After examination and trial we definitely recommend it as an article of great utility."

Obtainable from

**Photographic Suppliers, Stores  
and Stationers Everywhere:**

11 yds. x  $\frac{1}{2}$  in., complete in  
sealer ..... 3s. 6d.  
11 yds. x 1 in., complete in  
sealer ..... 4s. 5d.  
Refills ..... 2/- and 2/8

And in seven other sizes.

LONDON Phone: NAT. 0591 E.C.1

### ENSIGN DOUBLE-8

With ENSAR f/4.5 ANASTIGMAT.  
 16 pictures on V.P. (Size 27) Film.  
 Hinged back, 3-speed Everast shutter, depth-of-focus scale, direct optical sighting view-finder. Fits comfortably in pocket or hand-bag. Remarkable value. Price, including leather £3:12:6  
 9 monthly payments of 5/8.

### REFLEX-KORELLE

Takes 12 pictures on 3 1/2×2 1/4 8-exposure roll film. Film-wind and shutter-wind are coupled. A counter indicates number of exposures. Lenses are interchangeable. Stop and distance scales read from above. Collapsible frame finder. Focal-plane shutter gives time, bulb and instantaneous exposures from 1/10th to 1/1,000th sec. With f/3.5 Schneider Radionar £10:10:0  
 Nine monthly payments of 24/6.

### SALEX CINÉ TRIPOD

Made of duralumin for strong wear. Light and compact for carrying. The legs are stout and rigid. Fitted with screw clamping device and panning and tilting device.

**£5:15:0**

Fine monthly payments of 13/6.

### Super Sport DOLLY

Model C takes both sizes 2 1/4×1 1/2 and 2 1/2×2 1/2 on roll film, also plates 2 1/4×1 1/2 (4 1/2×6 cm.), with focussing on focusing screen. Clip-on slides. Reverse spooling giving possibility of using alternatively films and plates, and of interspersing exposures of 2 1/2×2 1/2 and 2 1/2×1 1/2 on the same spool.

With Meyer f/2.9, Compur shutter £10 10 0

With Schneider Xenar f/3.9, Compur £12 12 0

### 'BRILLIANT'

Takes the standard 3 1/2×2 1/4 8-exposure roll film at 1/-, but gives 12 2 1/2-in. square pictures. The brilliant image shows almost full size. With Compur shutter. High-grade f/4.5 Skopar lens. £5:15:0  
 Nine monthly payments of 13/5.

Or with Compur Rapid shutter £6:15:0

VOL. LXXX. No. 2439.

THE "Snapshotting" season is now at its height. August is the holiday month when not only the great majority of workers in town seek the coast and the countryside for their annual vacation, but it is also holiday time for the schools. The enormous spread of photography as a hobby is evidenced by the popularity of the camera among schoolboys and schoolgirls. In many cases they take their snapshotting more seriously than their elders. This may be observed at every seaside resort. The grown-up who uses a camera only at holiday time for securing records of the event and of the members of the party is apt to be casual about the business, and can hardly be considered an amateur photographer at all. The youngster, on the contrary, approaches the subject with much greater deliberation, and, possibly on the score of the cost of films, is more careful with each exposure. These younger camera users will in many cases become the serious workers of tomorrow, and we hope that every encouragement will be extended to their activities during the present month when so many opportunities for picture-making occur.

### Dark-room Luxury.

The dark-room suite at the new Middlesex Hospital, attached to the X-ray department which is the gift of one of the fairy godfathers of that institution, is the last word. Really the last word. It induces such a watering of the mouth on the part of one who has had to put up with a cupboard under the stairs as to make him quite unhappy. In the first place, all the films are conveyed to the dark-room by an electric conveyor. Next to the dark-

## TOPICS of the Week

### A Weather Forecast

FOR THE WEEK

By D. K. BARTLETT.

#### THURSDAY, AUGUST 8th.

There are likely to be some thunderstorms across the Eastern half of England during the day, which will mean heavy clouds and sunny intervals, the sunshine increasing in amount across the Midlands to the Western Counties, where early drizzle or mist will occur.

#### FRIDAY, AUGUST 9th.

This should be a fair day, warm temperatures in the East to average farther West. Breezy intervals and a good deal of moisture in the air will cause cloud effects, particularly off the coasts.

#### SATURDAY, AUGUST 10th.

After early strong breezes, which will clear the atmosphere, it will become warm and fairly good weather, making it somewhat hazy in the South-East to clear, with some cloud farther West and North.

#### SUNDAY, AUGUST 11th.

Slowly changing weather will be noticeable, with occasional cloud in the East, and unsettled conditions farther North into Scotland and Western areas, to good photographic weather in the South, with sunny periods to mainly fine.

#### MONDAY, AUGUST 12th.

Some bright and sunny periods across the Southern Counties from South-East and South Coasts to Wales into Ireland. Farther North, along the East Coast and into Scotland, occasional cloud.

#### TUESDAY, AUGUST 13th.

Mainly fine with much sun and bright weather, warm temperatures over Great Britain generally, with perhaps more haze and misty type of atmosphere along the East Coast through the hilly areas of Scotland, and a tendency in the South-West of England and Wales, and off the Channel Coasts in the South-East.

#### WEDNESDAY, AUGUST 14th.

Similar weather conditions should continue in all parts, with softer light effects and shadows to the North and East of England into Scotland, and in the South-East and South-West of England and Wales some heavy clouds.

room is a mixing-room, where the developer and fixing solutions are mixed in large tanks. These solutions are then run by pipe lines to the tanks in the dark-room. Consequently there is no necessity to stop work in the dark-room while large quantities of developer and fixing solution are being mixed. The developing tanks are thermostatically kept at a constant temperature, and there are electromagnetic clocks which time the period of development. By this means unskilled labour can be used for developing the films. Through a light-trap revolving hatch the films are passed to the drying-room, where they are washed in special tanks. There are weirs to prevent back wash, so that the fixing solution is washed off the films very rapidly. Through the drying cabinet 35,000 cubic feet of filtered air is blown per hour at 90 degrees centigrade. The films are conveyed on an endless chain driven by a motor, so that they come out at the other end completely dry in twenty minutes. It is altogether a robot department, down to the date punch, which not only punches the date on every film, but by means of a cyclometer records at the end of the day the number of films dealt with in the department.

### Lantern Slide Sizes.

One international convention which is badly needed is an agreement as to uniformity in lantern slide sizes. Last week in London the neurologists from twenty different countries met for an international congress, and many of them brought lantern slides to illustrate their papers and discussions. But again and again it happened that talk was held up because the lecturer could not get his "foreign" slides

into the lantern, or, if they did get in, some important details were just outside the frame and could not be pushed along anyhow. Here is a useful little work for Geneva to undertake during an off-moment while settling the Abyssinian dispute. Or perhaps it comes more properly before such a body as the British Standards Institute, which has international affiliations. As to lantern slide size, is there anything to beat our own square shape and size? It may be prejudice, but foreign slides look ungainly somehow. The fundamental trouble is that a change of size involves the scrapping of much apparatus and countless slides.

### How Many Disguises?

There is a story in Hachette's well-known "Almanach" which we seem to have heard before, but which is worth retelling. It was expected that a dangerous bandit would attempt to cross an out-of-the-way frontier in Europe, so the authorities communicated with the frontier police, and to make assurance doubly sure, sent them six photographs of the bandit—front face, side face, with a beard, without a beard, disguised as this, and disguised as that. The frontier police got to work with their customary assiduity, and in a day or two reported that they had five of the rascals already under lock

and key, and hoped to make a speedy capture of the sixth! While on the subject of identification by the camera, a word may be said about one of the species of photographic fiends—usually a girl—who says she must take a snap of you, and while you are engaged on the preliminaries, making the usual footling jokes one does make on such occasions, lets off before you have time to compose your face. The result is sometimes a happy and unstudied expression, but often it is a face one would most willingly disown. We have a suspicion that many newspaper portraits were obtained in this way much to the disgust of the "sitters."

## "The Amateur Photographer" EXPOSURE TABLE—August

EVERY MONTH a brief exposure table will be provided for the assistance of our readers in their practical work. A glance at the current approximate exposures as here given will serve as a reliable guide for most purposes. The subjects will be varied to suit the time of year. The following exposures will serve as a working guide for any fine day during the month, between the hours of 10 in the morning and 2 in the afternoon, with the sun shining, but not necessarily on the subject. Stop used, f/8. The exposure should be doubled if the sun is obscured, or if stop f/11 is used. For f/16 give four times the exposure. For f/5.6 give half. From 8 to 10 a.m. or from 2 to 4 p.m. double these exposures. From 6 to 8 a.m. or from 4 to 6 p.m., treble them.

From 5 to 6 a.m. or 6 to 8 p.m., about four times these exposures will be required.

N.B.—The times given above are by "sun time." The exposures, therefore, which are laid down as suitable for 2 to 4 p.m., for instance, will be those to be given between 3 and 5 p.m., by the clock, during "summer time."

SUBJECT.	Ordinary.	Medium.	Rapid.	Extra Rapid.	Ultra Rapid.
Open seascapes and cloud studies .. ..	1/30 sec.	1/45 sec.	1/90 sec.	1/120 sec.	1/150 sec.
Open landscapes with no very heavy shadows in foreground, shipping studies or seascapes with rocks, beach scenes ..	1/18 "	1/30 "	1/50 "	1/70 "	1/90 "
Ordinary landscapes with not too much foliage, open river scenery, figure studies in the open, light buildings, wet street scenes	1/10 "	1/15 "	1/30 "	1/40 "	1/50 "
Landscapes in fog or mist, or with strong foreground, well-lighted street scenes ..	1/8 "	1/12 "	1/25 "	1/30 "	1/40 "
Buildings or trees occupying greater portion of pictures, river scenes with heavy foliage	1/4 "	1/6 "	1/10 "	1/15 "	1/20 "
Portraits or groups taken out of doors, not too much shut in by buildings .. ..	1 "	2/3 "	1/3 "	1/4 "	1/5 "
Portraits in well-lighted room, light surroundings, big window, white reflector ..	4 secs.	3 secs.	1½ "	1 "	3/4 "

As a further guide we append a list of some of the best known makes of plates and films on the market. They have been divided into groups, which approximately indicate the speeds referred to above. The hypersensitive panchromatic plates and films require less exposure than the ultra-rapid.

# Causes of Defective Roll-film Negatives

The following topical article should be read by all users of roll films. Attention to the points dealt with will do much to avoid many of the defects seen in roll-film negatives.

**I**N these days, roll film is regarded as a negative material of almost universal application, and its use is by no means confined to the casual snapshotter.

The serious photographer has now come to realise that negatives upon the best of modern roll films are equal, and in some respects superior, to those on plates, while the film has the obvious advantages of daylight loading, lightness and freedom from risk of breakage.

In careful hands the roll film can be made to produce perfect negatives, but there are defects met with peculiar to this material, through non-observance of certain points which are dealt with in this article.

## *Handling the Spool.*

It must be admitted that most of the defects met with on film negatives are the result of lack of care in handling the spools. Many photographers seem to fail to realise that even when the spool is tightly wound within its protecting paper, if the latter is not kept tight, or if the spool is exposed to very strong light, fogging at the edges is inevitable.

Care must be exercised to keep the film tight upon its core after the securing band has been broken, when loading the camera. If the operation must be done in strong light, only sufficient of the paper backing should be unrolled to permit of threading into the receiving spool. These may seem obvious precautions, but many photographers fail to observe them.

Modern roll-film cameras are designed for easy loading, and to keep the film flat in the focal plane.

Care must be taken when threading the paper that it will run straight. Neglect of this means edge fog, or the film may become jammed, particularly in the case of very small

cameras where the space in the spool chambers is reduced to the minimum dimensions.

These points apply with even greater importance to the highly sensitive panchromatic roll films.

Some amateurs have a habit of twisting the spool in the hands after removing it from the camera. This does no good, as any properly-made camera will wind the film with sufficient tightness, while the very fact that the spool is taken from the camera in daylight is sufficient to cause the trouble, and tighter winding will not prevent it.

The twisting of the spool has also the result of producing fine scratches across the negatives.

Another point worth mentioning is concerned with the sealing of the rolled-up spool after removal from the camera. With most makes it is necessary to fold the pointed end of the backing-paper and tuck it under before the gummed strip for sealing can be secured. Many amateurs fail to fold the paper back far enough to make a tight join, with the result that the spool unrolls a little, and this is frequently enough to fog the film at the edges.

## *The Camera.*

While not peculiar to roll-film apparatus, the importance of a dust-free camera must be stressed. It must be realised that the mechanical action of winding the film from one spool-chamber to the other is in itself sufficient to cause minute particles of celluloid or emulsion from the edges of the film to become detached. This in the course of time is bound to result in an accumulation of dust. Frequent dusting of the camera, not forgetting the folds of the bellows, or in the case of a camera of larger size the use of a suction cleaner, is to be recommended.

The interior should also be examined from time to time to see whether all the parts are truly dead-black. The back ring of the lens and the edge of the inside of the camera back are frequently sufficiently bright or polished to cause mysterious fog-marks when photographing in certain conditions of lighting. A good dead-black can be obtained from any dealer, and is easily applied with a small brush.

The rollers over which the film travels should run freely, and the pressure plate which holds the film flat in the focal plane should be examined from time to time. If either do not function properly, the result will be scratched negatives.

## *The Film in the Camera.*

When extending a folding film camera, the front should be drawn out gently, and not jerked out, as is the practice of some photographers. This not only imposes a strain upon the camera front, but also tends to draw the film out of the focal plane, with a bad effect upon the definition.

When winding the film the camera front should be extended, and not closed. This is especially important if the camera is one of the small, compact type. Space has been so reduced that the folds of the bellows almost touch the film, and if winding is done with the camera closed scratched negatives are inevitable. In any case, winding the film should be done slowly and steadily.

Cameras need more care than is usually bestowed upon them. Very often expensive film cameras are to be seen upon the sands, quite unprotected from sun or sand. This is likely to cause trouble on one score or another.

Attention to the simple precautions indicated in this article will do much to prevent most of the defects common to roll-film negatives.

# Some Advantages OF A Long-Focus Lens or Telephoto Lens

with special reference to miniature cameras

By R. W. JOHNSTON.

ENOUGH advantage is not taken of the opportunities offered in the modern small camera for the use of a long-focus lens. We know that the normal focal length of lens for any camera is approximately  $1\frac{1}{2}$  times the longest side of the negative or contact print. Thus the focal length of lens for a Leica or Contax is 5 cm., or

"The Chimney Pot." From a miniature negative taken with 2-in. lens.

"The Chimney Pot." From a miniature negative taken with  $5\frac{3}{8}$ -in. lens. From approximately the same spot as print above.

2 inches, i.e., from the diaphragm to the image is 2 inches. A lens with a proportionately greater focal length is known as a long-focus lens. A telephoto lens is a long-focus lens which is fitted with a negative lens as one of its components; this has the effect of giving an equivalent focal length greater than that distance from the lens to the image.

Thus the Dallmeyer 12-in. telephoto lens of  $f/4.5$  for the Leica is much less than 12 in. long, although its focal length is 12 in., giving a  $\times 6$  magnification. A long-focus lens of the same magnification for a quarter-plate camera would require an extension of over 40 in., and would be of considerable weight. Furthermore, great speed would be impracticable with a lens of this enormous focal length, because a lens of that magnitude, to possess the same relative speed, would have to be of gigantic

proportions—as the speed of a lens depends upon the ratio between the width of aperture and the focal length. Therefore, with a focal length of 40 in. and only  $f/8$ , the aperture would have to be 5 in. wide. The bulkiness and expense of such a lens make it prohibitive. Even with these difficulties surmounted you are faced with the bugbear of a shallow depth of focus. It is an immutable law of optics that the greater the aperture and the longer the focal length, the shallower becomes your depth of focus. The margin on each side of the exact focus would be so small as to render such a lens useless unless stopped down to  $f/36$  or smaller.

This explains why a long-focus lens on a big camera does not offer the same advantages as a long-focus lens on a miniature camera.

The illustrations accompanying this article were made with a 2-in. and  $5\frac{3}{8}$ -in. lens. For general purposes this

From a miniature negative taken with  $5\frac{3}{8}$ -in. lens. It shows good perspective and the figures separated from background.

# An Ideal All-Purpose "Miniature"

## FEATURES:

F/4.5 Ensar Anastigmat in focussing mount to 3 feet.

16 pictures on V.P. (size 27) Film.

Direct optical all-enclosed sighting finder.

Depth-of-focus scale.

3-speed Everset shutter.

Hinged back.

Size: Illustration is actual size.

ACTUAL SIZE.

**With ENSAR Anastigmat F/4.5**

**£3 : 12 : 6**

including leather slip case.

The all-enclosed Optical Finder is ideal for rapid and accurate composition and sighting.

## YOU CANNOT DO BETTER

### THE NEW MODEL IIIa LEICA

The Precision Camera.

F/2 Summar, automatic focussing, interchangeable lens mount, all chromium plated. £43:0:0

Nine monthly payments of 100/8.

Model III, f/2 Summar, self-capping focal-plane shutter, speeds 1 to 1/500th sec., T. and B., chromium plated. £40:16:0

Nine monthly payments of 95/3.

### THE ZEISS IKON SUPER IKONTA

520 Super Ikonta with the NEW Rapid shutter. No. 520. Takes 18 pictures on standard 3½ x 2½ roll films.

Fitted f/3.5 Zeiss Tessar anastigmat, Compur Rapid shutter, speeds 1 to 1/500th sec., T. and B., self-recting front, built-in rangefinder, ensuring critical focus for every picture. £18:12:6

Nine monthly payments of 43/6.

### The Zeiss Ikon IKOFLEX

#### A TWIN-LENS REFLEX.

12 pictures 2½ x 2½ on standard 3½ x 2½ roll films.

£7:15:0

Nine monthly payments of 18/1.

F/4.5 Novar anastigmat, Ikonflex 3-speed shutter, 1/25th, 1/50th, 1/100th sec., T. and B., helical focussing, metal hood, fitted with magnifier, automatic film-winder by means of lever, will take metal or wooden-core films.

F/6.3 Novar anastigmat, 3-speed shutter, 1/25th, 1/50th, 1/100th sec., T. and B. £6:12:6

Nine monthly payments of 13/9.

### THE FOTH-DERBY FOCAL-PLANE AN IDEAL SPORTS CAMERA.

Takes 16 pictures on V.P. Film.

F/3.5 Foth anastigmat, self-capping focal-plane shutter, with delayed-action device, speeds 1/25th to 1/500th sec. and B. Very compact. £5:5:0

Nine monthly payments of 12/3.

### THE NEW ROLLEICORD

F/3.8 Zeiss Triotar anas., Compur shutter, speeds 1 to 1/300th sec., T. and B. £12:15:0

Nine monthly payments of 29/8.

The new Rolleicord takes 12 pictures on standard 3½ x 2½ roll films, and is also adapted to take the Rolleidex Plate back and other Rolleidex accessories, excluding the cine-film attachment and angle mirror.

### THE NEW REFLEX-KORELLE

Self-capping focal-plane shutter, speeds 1/10th to 1/1,000th sec.

F/3.5 Schneider Radionar anastigmat, double exposures an impossibility, the shutter lever being coupled with the film-wind. Interchangeable lens mount. Stops and distance scales are read from above. Collapsible frame under for taking pictures at the eye-level. All-metal, leather-covered body. Takes 12 pictures 2½ x 2½ on standard 3½ x 2½ roll film, complete in leather. £11:15:0

Nine monthly payments of 27/5.

### THE VICTORIA NEW MODEL

16 pictures on standard 3½ x 2½ roll films.

F/2.9 Meyer Trioplan anastigmat, delayed-action Compur shutter, 1 to 1/250th sec., T. and B. Body of reinforced composition, opens automatically to infinity. Focussing adjustment for near objects, optical direct-vision finder. £6:19:0

Nine monthly payments of 16/3.

### THE BALDAX

Takes 16  
pictures on  
standard  
3½ x 2½  
roll films.

F/3.5 Meyer Trioplan anastigmat, Isoor shutter, speeds 1 to 1/150th sec., T. and B. £6:5:0

Nine monthly payments of 14/7.

F/3.5 Meyer Trioplan anastigmat, Compur shutter, speeds 1 to 1/300th sec., T. and B. £7:7:0

Nine monthly payments of 17/2.

August 7th, 1935

13.5-cm. (5½-in.) lens with an extreme aperture of  $f/4.5$  is as big as one would be likely to require. In fact, it is a little bit too big for everyday use. A lens of double the normal focal length is considered to be best for most purposes. A long focal length means a very steady camera. With a 13.5-cm. lens it is almost essential to have your camera firmly mounted on a stand and to use a wire release.

Many folk imagine that the principal use for a telephoto lens is for photographing wild animals, birds and other unapproachable subjects. This is by no means the case. The long-focus lens can be used with advantage in nearly every type of photography. By reason of the necessary long distance between the camera and the object, the perspective is more agreeably rendered. You get what is known as true drawing and fine modelling. This is a great advantage in portraiture and in taking close-up pictures generally. This can be seen, for example, in the third illustration.

The shallower depth of focus in a long-focus lens can be made good use of to isolate the subject from its background. It

causes the principal object or centre of interest to stand out more clearly in almost stereoscopic relief, when taking pictures at short range.

One of the advantages claimed for the miniature camera is its great depth of focus due to its short focal length. This is sometimes a disadvantage owing to the inability to make use of what is known as differential focussing, i.e., focussing on the subject to the exclusion of the background, which is purposely left out of focus. By the use of a longer-focus lens differential focussing can be as easily practised as with a large camera. This point is also in evidence in the third picture.

Lastly, let me say that it is a great advantage to use a view-finder which shows the exact picture for a lens of a given focal length, otherwise you must guess how much of the picture taken with a telephoto lens will appear on your negative. These tiny negatives give you no margin to play with. It is far better to know exactly how much of the picture in your view-finder will appear on your negative, otherwise your composition must be haphazard and unsatisfactory.

# DEVELOPING Panchromatic Materials

By S. E. L. M.

**S**UCCESS in panchromatic work depends very largely upon the manner in which dark-room operations are carried out. Where suitable methods are not adopted, it is only by accident that a satisfactory negative is occasionally obtained; given proper treatment, however, there should be no difficulty in producing clean, bright negatives free from excessive contrasts.

Development may be by the method of "time and temperature," or it may be conducted by visual examination. Where the former method is adopted, few precautions beyond those ordinarily employed are necessary—though (especially where the materials being used are unfamiliar) a few experiments may have to be carried out before precise factors for any particular grade of panchromatic material can be arrived at. Thus it will be found that plates or films possessing fast emulsion speeds may require factors far different from those applicable to other materials.

## Tank or Dish.

Notwithstanding the introduction of highly efficient tanks, development by inspection—or *dish* development—is still very popular with a large number of pictorial workers and other amateurs.

The method is less convenient, though quite safe. It is also very simple, though for purposes of description it may be divided into five distinct operations. These are:

- (1) The removal of backing material (in the case of plates);
- (2) desensitisation;
- (3) development proper;
- (4) fixation (with or without hardening), and
- (5) washing.

The first operation may be carried out as soon as the materials have been safely transferred to the dark-room. Here, *in complete darkness*, the plates or films should be soaked in a trough of water, and, if plates, the backing dope carefully removed with a swab or with the fleshy part of the hand.

When this has been done, the materials should receive a final rinse in clean water, after which they may be transferred to the desensitising bath. Many amateurs and several of the D. & P. people entirely dispense with the preliminary de-backing operation, but this is not desirable, since the free backing not only contaminates subsequent baths but has been held responsible for uneven development through coming to rest on the surface of the emulsion layer.

The cheapest effective solution for desensitising consists simply of a very dilute solution of pinacryptol green. This commodity is sold in handy bottles containing one gramme—the whole of which should be dissolved in twenty ounces of warm water.

The desensitiser should not be used in this form, but should be rendered more dilute immediately before use, one ounce of the concentrated stock being further diluted to make twenty ounces of the working solution.

The time allowed for desensitisation is two minutes, after which the panchromatic or orange safelight may be switched on and remaining operations gone through in greater comfort.

Development itself may be carried out with almost any of the proprietary solutions, though where home-compounded developers are being used it

may be found more satisfactory to employ M.Q. than the familiar pyrosoda. The time of development also depends upon the nature and speed of the materials concerned, and in all cases this can be ascertained after only a little experience in their use.

## Fixation and Washing.

After development it is best to rinse the negatives in a dilute acid bath; this effectively checks further development and reduces the risk of "mottling." An acid-fixing-hardening bath is better than plain hypo, if only for the reason that it prevents "frilling," a common trouble at this time of the year.

The period of immersion should not be governed by the disappearance of creamy emulsion from the image surface, but should continue for about ten or twelve minutes. On no account must any materials be left in the fixing-bath for more than twenty minutes; immediately the bath becomes slow-working it should be changed in readiness for the next batch of work.

Washing may be performed in running water, or it may be done by the method of changes. In warm weather, the operation by either method should be completed in forty minutes. At the end of this time, a final rinse in acidified water—made by adding a few drops of lemon juice to a quart of soft water—should follow. "Clean" workers usually finish their washing by removing surplus moisture from both sides of the material with a chamois cloth, thoroughly softened by immersion in the lemon bath and squeezed free from surplus between the palms of the hands.

August 7th, 1935

At the present day everyone packs a camera as a matter of course when going on holiday, and probably seven-tenths of the year's photography is done at the seaside, but it is tragic when one considers the poor lot of snaps the average camera owner brings back.

Yet it can safely be said of all the subjects one can take with the camera those taken at the seaside are the easiest from the technical side. It is on the pictorial side that most failures occur. But any camera will do. Even the box type of instrument costing not much over half a guinea can be used with as much chance of success as the twenty-guinea model, complete with  $f/4.5$  lens and a split-second shutter of many speeds. For the light by the

Sunday. A panchromatic film or plate better rendering of the sky tone

# PICTURE-MAKING at the Seaside

By F. READ.

The Breakwater.  $1/100$ th sec.,  $f/11$ . Pan film, no filter.

Pan. film and filter.  $1/50$ th sec.,  $f/8$ , with lens hood.

sea is good, and exposures at  $f/11$  or  $f/16$  will be the rule rather than the exception.

Where most people fail with their seaside photographs is not so much from the limitations of their camera but rather from lack of observation and not using the proper material. The really keen amateur can be relied upon to go to the sea with colour-correct material and filters; but the average camera owner seems quite unaware of the difference that can be secured by the aid of the modern panchromatic emulsions. He just buys half a dozen spoils

Pan. film, no filter.

and with a filter would have given a  
used when taking this picture.

of ordinary film and snaps away at anything that presents itself, and when his films are developed frequently suffers a keen sense of disappointment.

If he cannot afford to buy a de luxe type of camera he can use even in his half-guinea box instrument a panchromatic film of the S.S. type, and if he is also prepared to go to a little extra trouble and make his exposures through a "two-times" filter he will find his pictures still further improved.

This is one of the secrets of photography by the sea. The filter will see to it that the predominating blue is rendered an appreciably darker tone on a pan. film, and so give the lighter

Taken with pan. film and filter. Note rendering of flesh tones against blue sky.

The Pier at Night. Exposure 10 secs., f/8.  
S.S. pan. film.

tones a chance to distinguish themselves, and make a success of a scene that would otherwise be a failure.

There is one point, however, that camera owners who take their films to the chemist or dealer to be developed should be careful of, and that is to make sure that the operator knows that he is dealing with panchromatic materials, and that they should be developed in complete darkness.

Finally, do not snap at the usual things, unless they are being taken as personal records. Look out for good sky effects and pleasing lines of shore

# NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

The latest date for sending in pictures for the Royal Photographic Society's exhibition is Friday, August 16th. Readers who are intending to send to the R.P.S. show this year should make a note of this date and not overlook sending their prints in good time.

A new D. & P. gaslight paper has just been put on the market by Criterion, Ltd. This is supplied in "soft," "ordinary" and "vigorous" grades, but has the novelty of being a "cream" glossy paper. Although it is being supplied principally to photo finishers, amateurs who make their own prints can also obtain it from dealers or from Criterion, Ltd., Stechford, Warwickshire. It is an excellent material with all the good qualities of the Criterion products.

A special "Cowes" Number is issued this week of "The Yachting World." Our readers who are interested in the photography of yachts, and have an opportunity of visiting the Solent to see the great yacht-racing events of the year should secure a copy. It contains much information that will prove useful to the yacht photographer.

After we had gone to press last week we received an intimation that the Summer School (announced for August 2nd to 5th) of the Independent Film Makers' Association had been unavoidably postponed. Further news of the meeting will be given in a later issue.

Awards in the Print-trimming Competition.—The final decision in this competition has been arrived at after a great amount of consideration and careful comparison between many thousands of entries. In some cases hundreds were very nearly similar, although on close investigation no two were precisely alike. After weighing up the pros and cons of the different groups, each including an astonishing number which

were less than postage stamp size, the following awards were made. Two prizes of one guinea each to: R. Jones, 49, Abbeystead Avenue, Netherton, Liverpool, 10; L. Abrams, 140, Elm Grove, Southsea, Hants. Two prizes of half a guinea each to: Robert G. Hammond, 10, Mildmay Road, Chelmsford, Essex; Thomas Hamilton, 183, Culrain Street, Shettleston, Glasgow, E.2.

Johnson's Holiday Competition has again been announced, and fifty cash prizes and fifty consolation prizes of photographic material are offered for holiday snapshots. The closing date is October 31st. There is no entry fee, the only condition being that labels or the title panel of a printed carton from certain of Johnson's photographic preparations must be sent with each entry of two prints. Holiday snapshots may be of any subject and on any make of plate or film. A leaflet with full particulars and rules will be forwarded free on application to any reader of "The A.P." who writes to Messrs. Johnson & Sons, Ltd., Hendon Way, London, N.W.4.

Paraphenylene-diamine as a developing agent for very fine grain has long been recognised, but unfortunately its big disadvantage of being poisonous and a disagreeable irritant to the skin has restrained its use by amateurs. By the recent introduction of Supramin, a fine-grain developer for negative material, the toxic properties of paraphenylene-diamine have been entirely removed, so that we now have a harmless developer giving extraordinarily fine grain. This is not the only desirable quality of this developer. The bromine released from the blackened parts of the negatives has little or no effect on the developing agent, with the result that the developer can be used over and over again with no loss of quality in the negative and no cumulative

increase in developing time. As with all developers of this type, Supramin, at its normal dilution, takes anything from fifteen to thirty minutes, according to the emulsion characteristic, at a temperature of about 65° Fahr. to give normal contrast negatives; but, if desired, by dissolving the contents in only half the normal quantity of water, the developing time is reduced by approximately half, the image still retaining its fine grain. Although it has a port wine colour there is no staining of the gelatine, but there is just enough stain in the image to give a stronger printing density. The user will, therefore, find it advantageous to keep the development time on the short side. It is also claimed by the makers that Supramin compensates for over-exposure, and, on test, this has proved correct. Another interesting fact about this developer is that temperatures up to 80 degrees Fahr., while not advised, do not make the difference in the grain size that one would expect; in fact, our own test at 78° Fahr. showed no perceptible increase of grain. Supramin is available in tins sufficient for 36 oz. of normal developer at 1s. 10d. per tin, and larger quantities are available at cheaper rates. It is supplied by all photographic dealers, or direct from L. A. Leigh, at Balfour House, 119/125, Finsbury Pavement, London, E.C.2.

Under the name "Superfix" a new photographic mountant has recently been placed on the market. It is remarkably adhesive. One portion of a piece of paper was coated with "Superfix" and rubbed into contact with another piece of similar texture. Immediately afterwards, an attempt was made to pull these apart. The resulting pull caused the uncoated part of the paper to tear, leaving the treated portions firmly joined together. "Superfix" is contained in tins, with a compartment for the brush. The bottom of the brush-holder contains a thin layer of paste, this keeping the bristles of the brush moist for use. It is manufactured by Middlemass & Co., Ltd., Islington Wharf, Penryn, Cornwall, who will be pleased to send full particulars.

## Exhibitions and Competitions CURRENT AND FUTURE.

Notices of forthcoming exhibitions and competitions will be included here every week if particulars are sent by the responsible organisers.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers. Entries, August 31. Rules in the issue of July 31.

California Pacific International Exhibition, San Diego.—May 29–November 11. Particulars from Miss Ruth Kilbourne, Exhibition Headquarters, Balboa Park, San Diego, Cal., U.S.A.

Paris International Salon.—October 5–20. Secretary, M. E. Cousin, 51, Rue de Clichy, Paris.

Szeged (Hungary) International Salon.—August 4–21. Particulars from Secretary, Magyar Amatortenykepek, Szovetsege, Csoportjonak, Szeged, Hungary.

Southern Counties Salon (organised by Camberwell C.C.).—August 11–31. Hon. Salon Secretary, W. Bertram, 45, St. Lawrence Road, Brixton, S.W.

South African Salon (Johannesburg).—August 26–31. Hon. Secretary, Johannesburg Photographic Society, P.O. Box 7024, Johannesburg, South Africa.

Amsterdam International Salon.—September 14–29. Further particulars from Focus, Ltd., Fotosalon, Bloemendaal, Holland.

London Salon of Photography.—Entries, September 4; open, September 14–October 12. Further particulars from Secretary, London Salon, 52, Pall Mall East, S.W.1.

R.P.S. Annual Exhibition.—Entries, August 16; open, September 14–October 12. Further particulars from Secretary, 35, Russell Square, W.C.1.

Irish Salon (to be held at Mansion House, Dublin).—Entries, September 14; open, November 2–9. Particulars from Hon. Secretary, Irish Salon of Photography, 18, Morehampton Road, Dublin.

Rotherham P.S. International Exhibition.—Entry forms due, September 23; prints, September 30; open, October 16–19. Hon. Exhibition Secretary, E. George Alderman, Ruardean, Newton Street, Rotherham, Yorks.

Indian International Salon (promoted by Camera Pictorialists of Bombay).—Entries, October 1; open, November 17–30. Hon. Salon Secretary, F. R. Ratnagar, Central Bank Building, Fort, Bombay, India.

G.W. Rly. "Camp Coach" Holiday Competition.—Prize, one week's holiday in camp coach during 1936 holiday season. Photographs should depict

any aspect of camp coach holiday. Entries due, October 31. Further particulars from Superintendent of the Line, G.W.R., Paddington Station, W.2.

Canadian International Salon, National Gallery of Canada, Ottawa.—November 6–21, and afterwards in other Canadian cities. Entries due, September 20. Entry forms and further particulars from Exhibition Secretary, Canadian International Salon, National Gallery of Canada, Ottawa, Canada.

Cape of Good Hope International Salon (under the auspices of Cape Town P.S.).—Entries due, November 19; open, January, 1936. Hon. Salon Secretary, Richard Dekenah, P.O. Box 2431, Cape Town, South Africa.

Leicester P.S. International Exhibition.—Entries, January 24, 1936; open, February 24–March 7, 1936. Exhibition Secretary, H. Foscutt, 19, Doncaster Road, Leicester.

The 40th Annual Exhibition of the South London P.S.—Open, February 15–March 14, 1936. Entries close, January 21. Further details and entry forms from Hon. Exhibition Secretary, H. S. Adams, 40, Stockwell Park Road, London, S.W.9.

# ACCURACY

## By Coupled Distance Meter

The distance meter used on the Super Ikonta is made on the new patent Zeiss Ikon rotating wedge principle, and is coupled with the lens focussing. This construction is entirely new, and provides greater accuracy in the measurement of distances coupled with a robustness never before realised. To experience the wonderful accuracy of this distance meter ask your dealer to show you a Super Ikonta, take it in your hand, focus it on,

say, 6 ft., and you will find that a deviation of 2 or 3 inches from the point focussed will be shown on the distance meter. The Super Ikonta is now supplied in four sizes. The new  $2\frac{1}{2} \times 2\frac{1}{2}$  in. Super Ikonta has a locking device which prevents inadvertent double exposures, and many other original improvements, including the fastest lens fitted to a large-size miniature roll-film camera, the Zeiss Tessar f/2.8.

# SUPER IKONTA

## SUPER IKONTA PRICES

For 16 pictures  $2\frac{1}{2} \times 1\frac{1}{2}$  in., Zeiss Tessar f/3.5 and Compur Rapid shutter..... £18 : 12 : 6

\* For 8 pictures  $3\frac{1}{2} \times 2\frac{1}{2}$  in., with Zeiss Triotar f/4.5 and Kilo shutter..... £14 : 7 : 6

\* For 8 pictures  $3\frac{1}{2} \times 2\frac{1}{2}$  in., with Zeiss Tessar f/4.5 and Compur Rapid..... £19 : 0 : 0

\* For 8 pictures  $3\frac{1}{2} \times 2\frac{1}{2}$  in., with Zeiss Tessar f/2.8 and Compur Rapid..... £22 : 10 : 0

\* For 8 pictures  $4\frac{1}{2} \times 2\frac{1}{2}$  in., with Zeiss Triotar f/4.5 and Kilo shutter..... £16 : 5 : 0

\* For 8 pictures  $4\frac{1}{2} \times 2\frac{1}{2}$  in., with Zeiss Tessar f/4.5 and Compur normal shutter £19 : 15 : 0

For 11 pictures  $2\frac{1}{2} \times 2\frac{1}{2}$  in., with Zeiss Tessar f/3.5 and Compur Rapid shutter.. £25 : 5 : 0

For 11 pictures  $2\frac{1}{2} \times 2\frac{1}{2}$  in., with Zeiss Tessar f/2.8 and Compur Rapid shutter £28 : 5 : 0

*Zeiss Ikon cameras are obtainable from most good camera shops.*

Descriptive folder free. 80-pp. general catalogue for 3d. in stamps.

\* Also gives 16 divided pictures by using mask.

# how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCXCIII.

Miss AGNES  
B. WARBURG.

From information communicated to our Special Representative.

"EARLY in my photographic career I formed the habit of looking for pictures as I went about, noting how objects fell into a more or less pleasing arrangement as one moved one's position, and trying to gauge the monochrome values of receding planes. This has been a useful aid to work in the field, helping one to decide which is to be the main subject of a picture, and to find one's viewpoint quickly; whilst in travelling, and at times when a camera is not available, it adds immensely to one's enjoyment of a beautiful world.

"It is difficult to say in what the peculiar charm of picture-making lies, and just why one particular scene or person seems

to claim to be made into a picture, or, for that matter, why the subject which attracts one day leaves one unmoved the next. Apart from any intrinsic interest in the subject itself (as in an eminent person, an old building, a beautiful landscape), and the pleasing balance of form and mass, light and shade, which constitute a 'picture,' there must be some special and indefinable quality which gives the key to the character of the thing depicted.

"For this reason, the subject which attracts must be photographed *when seen*. One may return another day, but so seldom are all the conditions repeated that often the picture has vanished altogether. Yet on coming to a new district it may take some days before one is able to distinguish what is characteristic from what is merely unfamiliar.

"Most of my exposures are made away from home, when I have more free time and the detachment of the holiday spirit. Considerations of weight, cost and convenience have now made me one of the army of miniature camera workers, but I do not pretend that bromide enlargements from tiny negatives give me either the happy compositions or the printing quality of the platinotype prints I used to make from negatives secured with my old whole-plate stand or 5 x 4 reflex cameras.

"My first article of faith is that correct exposure is the secret of good photography, and I consider panchromatic emulsions with suitable filters essential for landscape work. Since, however, one cannot always live up to one's principles, a careful choice of printing paper and print developer will often draw success from an unpromising negative.

"I use films to save space and weight, and develop by time and temperature; and I use vertical enlargers to save time and temper. I may add that I have never had, or seen, a really practical enlarger to suit my requirements, and that even with the vertical type the problem of even illumination seems to be inadequately coped with.

"*'Camogli'* is a print on Royal bromide from a Rolleiflex negative on Ilford panchromatic film. I like the group of gaudily-painted boats in the shadow of the old building, and the way the composition is helped upwards by the drying sail, and the rising tiers of tenement houses which are characteristic of the Italian Riviera. The knot of folk on the little quay, and the old man musing in the hanging cafe, supply a human note.

"I admire much of the modernist work for its frank outlook and disregard for non-essentials, and for the amazing quality of its technique. *'Painting the Funnel'* was an attempt to group a number of bold shapes in the modern manner, but the light and shade are treated as atmosphere rather than pattern, and the pygmy clinging to his work high above the ocean is more emblematic than decorative. This print is from a 5 x 4 negative exposed in mid-Atlantic."

(A further example of Miss Warburg's work is reproduced on one of the centre Art pages.)

PAINTING THE FUNNEL.

Miss Agnes B. Warburg.

# Pictorial Analysis

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"SHRIMPS," by A. P. F. Service.

**E**XCELLENT as it is in its portrayal of a mood of childhood, this picture is also interesting for its attractive expression of the feeling of luminosity, and noteworthy in the degree to which the choice of viewpoint has resulted in the elimination of anything that might prove incongruous from the setting.

The two childish figures are well caught; their scale in relation to their surroundings is important enough to ensure their dominance in the scheme, but not so exaggerated as to suggest an inclination towards restriction; their poses are natural, and free from the slightest hint of camera or self consciousness; and, as the comparatively dark tone of their figures is shown against the lighter portion of the setting, they are properly isolated, and their tone helps to stress the impression of light and luminosity.

This latter quality is further emphasised by the introduction of the deeper darks of the reflections at the top, and by the slight increase in depth of tone from centre to base. By means of this arrangement of the light and shade, the principal mass of lighter tone is ranged around the centre and in the neighbourhood of the figures.

Besides stressing their importance as the centre of interest and aiding the manner in which they are displayed, the arrangement is calculated to enhance the unity of the composition, partly by directing the attention to the juxtaposition of figures and effect and the combination of the two attractions, and partly in view of the implied suggestion of framing or enclosure. Inasmuch, the picture is remarkably well designed, and, as far as placing is concerned, the figures, as a group, are sufficiently off the centre to avoid any impression of formality, and far enough away from the edge to prevent any idea of weakness.

Their position is perfectly adequate, and, incidentally, it may be mentioned that its strength is enhanced by the

fact that the points where their limbs enter the water—that is to say, their foundation—happen to fall along one of the diagonals.

This may be, and probably was, more or less fortuitous, but, if not deliberately designed, its good effect would, no doubt, be instinctively appreciated, for it is, to some extent, the reason why the second (1) of the

height—aided, in a measure, by the fact that the features of the second figure are visible and the first barely disclosed—is sufficient to give priority to the farther; the proximity of the nearer prevents her from becoming unduly insignificant, and provides her with an adequate claim for a share of the attention.

Another feature that is worthy of notice is the way in which the intentness of the children upon their self-imposed task has been recorded. Apart from its attraction as an element of the mood, which provides the major portion of the pictorial content, the feature is one which guards against the inclusion of a suggestion of camera-consciousness.

This is one of the greatest drawbacks in subjects of this type. It is the enemy of naturalness and a disfiguring note whenever it appears. Too often it spoils pictures that might otherwise be regarded as successful; but, when the figures are so absorbed as they are shown in this instance, it is comparatively simple, given reasonable care and avoiding bringing the camera forward until the last possible minute to get the subject without it.

Once the camera has been seen, it is next door to impossible to prevent it, nor, with children of this age, is it feasible to pose them without it making an appearance or without some loss of spontaneity.

In this instance, that attribute is fully in evidence. It enhances the expression of the mood, and, with its engaging charm and the aesthetic appeal of the effect, the picture exhibits an attraction that is simple and sincere.

It might further be said, perhaps, that the presence of visible sunshine would lend a greater vivacity, but, at all events, the feeling of luminosity does, to some extent, take its place, and, on the whole, the effort is worthy of commendation, and provides a good object lesson.

"MENTOR."

two figures is endowed with a somewhat greater significance than the first (2).

It places her higher in the picture space, and, other things being equal, such a position ensured pre-eminence. In a group of two, such as this, it is necessary that one of the figures should have a greater pull than the other, though it should not be so much in excess that the attraction of the second is rendered negligible. The appropriate adjustment of the two is always a matter of some little difficulty. Here, it has been well managed, for, while the difference in

# PICTURES by Novices

*SOME CRITICAL COMMENTS on  
the Beginners' prints reproduced on the opposite page*

"WHIPSNADE," by C. H. Carnarvon Brown—No. 1 of the prints reproduced on the opposite page—is quite an excellent effort in its class. The proportions of landscape to sky are nicely judged; the trees on each side are graceful in shape; the foreground is well modulated, and has sufficient depth of tone to carry the weight of the trees and large area of sky above; there is a pleasing suggestion of distance, and the sky itself has not only a hint of cloud forms but conveys an admirable sense of luminosity.

## **Balance and Formality.**

The figures in the middle distance are unimportant, but serve to add an interest, and, while the work is decidedly good, it does suffer from the drawback of too near an approach to formality in its arrangement.

This arises from the practical equality of mass between the groups of trees on each side. The balance is too exact. One or the other should be appreciably the more significant, and, as the shape of those on the left is rather more graceful, the fault could be corrected by trimming, say, a quarter of an inch from the right-hand side. That being done, the greater weight is on the left-hand side, and, though the impression of equality and formality is removed, the artistic balance is complete.

It is only in exceptional cases—and this is by no means one—that anything approaching an equal balance can be adopted in pure landscape, and, as a general rule, it is wise to see that what balance there is, is a balance of unequals.

The suggested adjustment brings this about in the case under discussion, and in another landscape subject—No. 5, "A Place in the Sun," by W. Collins—the proper relationship is seen between the chief element, the tree on the right, and its balancing accent, in the slender and much less significant birch towards the left-hand side.

## **Weight and Scale.**

Both by weight and scale, the tree on the right is the more important. Its mass is the greater, and its tone, as a light against a dark, is rightly more insistent than the tone of the

other. Yet the balance, from the pictorial point of view, is perfectly adequate, and certainly the composition does not seem to need any more forceful note upon the left-hand side.

At the same time, the bit of sky showing through the foliage on the right and between the fork of the tree bole proves a somewhat disturbing note, and might, with advantage, be toned down till unnoticeable.

It is inclined to conflict both with the light on the tree and that on the foreground, reducing their values, whereas, if it did not exist, the feeling of sunshine—which forms the artistic motive—would be much more effective and pleasing. The single light in No. 4, "Teneriffe," by K. B. Allan, tells with appreciable power, and consequently holds the attention because there is no other light as bright elsewhere and nothing to compete with it as the centre of attraction.

## **Centre of Interest.**

The remainder of the print has an appeal, it is true, but it is subordinate to the interest excited by that little bit of light. It is the supreme point of attraction in an interesting whole, and, because there is but the one definite centre of interest, it seems right from the point of view of arrangement; or, put in another way, the eye can view it comfortably and take it all in.

If another patch of light of equivalent power were introduced elsewhere, the eye would tend to stray from the one to the other, would be distressed by the dodging about, and the restful feeling that the present impression imparts would be utterly destroyed.

On the other hand, there is an excess of foreground, and at least a quarter of an inch of it could be dispensed with. A similar addition to the top, if possible, would improve the picture proportions; but, at any rate, the first consideration towards obtaining a successful composition—that of providing an effective centre of interest—is satisfied.

The effect of having two lights of equal, or nearly equal, significance is illustrated in No. 6, "The Mountain Stream," by John H. Kaye, for, with the light of the fall itself and the light in the stream below, the eye first looks

at the one, then at the other, and back, again and again.

## **Divided Attraction.**

There is, consequently, a division of interest, whereas, in the former case, interest was unified. In order that this subject might be made to show an equal degree of unity, either one or the other points of attraction must be cut out, or their pull must be made to coincide.

By a slight change of viewpoint, it might be possible to hide the fall, or, by a greater change, to avoid the inclusion of the note of competition in the stream; but this could only be definitely determined on the spot, and, whether the pull of the two could be united or not—a real and visible connection would have to be shown—could, likewise, only be found out by searching the vicinity.

In No. 3, "The Observatory," by J. G. Halley, there is a good, but unequal balance, between the two masses of foliage on each side. The lights on the building are sufficiently connected to count as one, and, viewing the print not too critically, it forms an adequate centre of interest. The dark foreground is a good point, too; but to allow the bush which falls on the left-hand side to obstruct the view of the observatory is an obvious oversight, particularly as, by moving a little to the right, its ill effect could have been entirely avoided.

## **Subjects with Figures.**

The figures in No. 2, "Heddon's Mouth," by H. E. Stopher, may have been intended to serve as a group forming the centre of interest, but their scale is somewhat small for the purpose, and they do not stand out too well from their surroundings.

Their importance, besides, is seriously impaired by the proximity of the extreme dark on the left-hand edge, which is over-insistent for its position, and, except for arranging for it to be excluded by the choice of a standpoint more to the left, and by waiting for the figures to assume a more prominent position, no effective remedy suggests itself. That, unfortunately, involves retaking, which is a pity, for, technically, the work is very sound. "MENTOR."

# With the Beginners

NOTES AND NOTIONS FOR THE  
LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

## A SIMPLE CAMERA AT THE ZOO.

I PROMISED recently to say something about the possibilities of using a simple  $3\frac{1}{4} \times 2\frac{1}{4}$  camera at the Zoo, and the other day I managed a flying visit. Those who are not attracted by this sort of work, or who have no place accessible for practising it, will find that much of what I am going to say applies equally to other kinds of subjects. Chancing being misunderstood, I may mention that there is not such a difference as might be supposed between photographing a woman and a parrot, or a photographic journalist and a bear. The principles involved are the same.

The  $3\frac{1}{4} \times 2\frac{1}{4}$  size is mentioned only because that was the one a reader enquired about, but other small sizes may be regarded as included, the main point being that the camera shall

be of simple form, with distinct limitations; and not, for example, an elaborate and costly reflex.

My own camera was by no means a cheap and simple one, but I soon took the conceit out of it. I set the lens at  $f/8$ , and the shutter at  $1/25$ th of a second, and without altering either I made a score of exposures in a couple of hours. Of these I scrapped four, but from the remainder I can find several to add to my collection of whole-plate prints of similar subjects. I could have done better if I had not deliberately taken things merely to illustrate certain points.

I certainly used the focussing scale, and ranged from 6 ft. to infinity. With a "fixed-focus" camera this cannot be done, and in that case the only plan is to find the shortest dis-

tance at which an object will be sharply defined with a given stop, and take nothing that is at closer quarters. If a camera can be focussed, and is scaled for certain distances, it becomes necessary to judge those distances at sight, and with reasonable accuracy. I know that many photographers say they are unable to do this, but that only shows that they have not taken the small amount of trouble necessary to learn to do it.

Even with a fixed-focus camera, long shots like that of the elephants are easy and safe. You can hardly miss them. This is assuming the elephants are there; very often enclosures are empty. If I had had my reflex I should have used a long-focus lens and picked out the animals from their surroundings.

What may be called "middle" shots, like those of the bear and the spotted deer, are also generally safe with a fixed-focus camera, although care is necessary to make sure that they are not appreciably inside the minimum safe distance for good definition. The deer is a matter of chance; the odds are against its being at a suitable distance, especially as it is so often tempted to the railings by offers of entirely unsuitable food. The bear is easier; it will repeat the same walk and turns over and over again, and the moment for exposure can be awaited.

The other print in this group is to show what happens when a bar of the fence is in front of the lens. The Zoo has been vastly improved since I first knew it, but in making alterations the authorities do not

consider the convenience of photographers. Close-meshed wire does not make matters easy for the snapshotter, although it serves useful purposes.

I do not think that modern workers at the Zoo are likely to get photographs of penguins, for example, anything like as good as some I have got. They look very much as they do in their wild haunts. Now they are in surroundings that suggest a circus, or a turn at a variety show. The general public apparently admire it; the penguins, I understand, approve it; I myself hate it.

The vulture I took as an example of

one of the things to avoid. The surroundings are hopeless. The vulture is there all right, but he is lost and overwhelmed, and there are no easy means of remedying the dreadful state of affairs. Many an otherwise good subject, and not at the Zoo only, must be missed on account of complicated and inharmonious surroundings. At the Zoo particularly it is a rare thing indeed for an animal or a bird to present itself in a good pose, properly lighted, at a practicable distance, and with a setting that gives it a chance to look natural.

When such a chance does come it is wise to make several exposures on variations of the same subject, using in this way the films that have been saved by refraining from taking obviously unsatisfactory subjects.

I took several owls, as the changeable light happened then to be favourable, but they were too close for most non-focussing cameras. It is certainly an advantage to be able to focus for "close-ups." The image of the owl reproduced is just half an inch high in the negative, but I can enlarge him, and the necessary quantity of tree stump, up to whole-plate without any trouble.

And that brings me to what I consider is a vastly important point. I would earnestly advise every owner of a small simple camera to beg, borrow, steal, make or buy some sort of enlarger, and learn to use it himself. Without it he is only half a photographer, or less—a mere vulgar fraction.

Almost every negative I took on this occasion needs to go into an enlarger. Look, for example, at the

one with the bar shadow across it. I can enlarge the dismal animal so that the result will hold its own well. It was an awkward subject, anyhow, but I took two others without the bar, and with these the enlarger will give me still better results. Use a small simple camera, by all means, but consider an enlarger as an absolutely necessary adjunct.

W. L. F. W.

## A Competition specially for Novices

### SUBJECTS.

Prizes will be awarded for the best snapshots of family groups or single figures taken at home or on holiday, indoors or outdoors. The arrangement of the groups or the pose of the figures is left entirely to the discretion of the competitor.

The competition is open only to novices: those who have never won an award of any description in a photographic competition.

Entries are restricted to contact prints. The smallness of the prints, which may be mounted if necessary, will not affect their careful consideration in this competition.

### PRIZES.

The prizes will consist of supplies of roll film or of plates (if any winner happens to use a plate camera).

THE FIRST PRIZE WILL BE TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.

THE SECOND PRIZE WILL BE TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.

THE THIRD PRIZE WILL BE ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.

TWELVE PRIZES OF ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

The winners of these prizes will thus be encouraged to continue their photographic activities throughout the year with a supply of free film.

### RULES.

Each print must have affixed firmly to the back, a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor.

The latest date for receiving entries is September 7th, 1935. This will give new readers, who are novices, who intend entering this competition every opportunity of improving their work during the next two months by reading "The Amateur Photographer" every week and obtaining their competition prints during the summer holidays.

The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed as follows: The Editor, "The Amateur Photographer," Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices' Competition."

Further references to the competition will be made week by week, and hints given for the best treatment of groups and figures.

Showing the effect of repetition. The parts marked 'A' are in varied repetition as well as the parts marked 'B.'

Above, repetition carried to the extreme, and, below, repetition used with discrimination.

# Picture Points

## for Beginners by RICARDO

### Repetition—More Examples

IN last week's series of "Picture Points" we examined the value of repetition in pictorial work. By repetition we mean the re-occurrence of similar lines, tones or masses in the same picture.

Repetition, like many other devices in composition, can be a good servant but a bad master. It must be handled sparingly and with discrimination if it is to be really effective. One of its chief advantages is that it is possible to make a really good picture out of what would otherwise look most unpromising material.

For example, in sketch on the right the simplest of landscapes is converted into something that has not only interest, but definite pictorial value. Here the repetition is well defined. Over the tree on the right we have a cloud which subtly repeats the shape, and again on the left another cloud repeats the shape of the house. Notice particularly that this second cloud does not repeat the first large cloud in either size or shape. This would only carry it to the extreme, and would result in a symmetrical cloud on either side of the picture, and, because they predominate in this particular subject, all pictorial interest would be lost.

In the still-life subject, other forms of repetition are shown. These are evident in the shadow of the glass jar and rod, and in the dark mass on the left and top, and again in the right-hand corner. For clearness' sake the parts marked A are in varied repetition, and again with the parts marked B. The ellipses in the glass jar also are repeated in the shadow and top of the picture.

Here the clouds are repeating the shapes of the tree and cottage.

### Repetition—Good and Bad

ANOTHER example of repetition—good and bad—is shown in the two sketches on the left.

The top sketch shows the effect of monotonous repetition, where, not only have the figures been repeated, but each sailor has precisely the same position and direction, while the tone values are also identical. Compare this with the second sketch. The repetition occurs twice—in the men themselves and again with the men and the ships. It will be seen, then, that the items need not always be of the same material to allow of successful repetition.

In this example it is the tone masses of the two ships which repeat the tone masses of the sailors. Of course, it is obvious that one cannot wait until other items turn up in the picture before one is justified in making an exposure. In this last example it would be far quicker to snap the men and then, later on, make another snap of two boats, and print them in with the men.

### Watch the Corners

THIS is, comparatively, only a small point to look for in exposing or printing, but one that might easily catch the sensitive eye of a judge in competition work.

Whenever we make two straight lines meet at an angle we immediately encourage the eye to their point of meeting. If we add another line and make it join the other two lines at exactly the same point the attraction is much stronger. It is stronger still when the two angles, thus made, tend to equal each other.

If we examine the corners of the first sketch on the left, we can see this effect. The edges of the sketch make an angle at each of the corners, and the lines of the subject matter meet them in the exact corners. The only remedy after the print is made is to use the trimmer.

In this particular sketch we would trim the top and bottom, and so bring the radiating lines to finish along the top and bottom edges instead of in the corners.

Another example is given with the landscape on the right. The tree, the cloud, the path and the edge of the pond, all finish in the corners. A trim off the top and bottom is suggested.

# Everybody Says **E. GORSE** For Fairest Dealing

## You must have **MOVIKON**

**Dead Accurate Focus. Rock-Steady Pictures.**  
**Mixes. Multi-Speeds. Parallax Finder.**  
**Inside Footage. Direct Focus on Film.**  
**Delayed-action Device.**

### OUTSTANDING FEATURES:

Takes any make 50 ft. or 100 ft. film, 16-mm. or 50 ft. automatic charger, films interchanging. Coupled range-finder focusing of dead accuracy (you can get the eyes sharp in close-ups, etc., etc.). Adjustable shutter (for high-speed objects at 16 pictures—saving film!). Automatic delayed-action up to 20 ft. of film (15 secs. delayed, then exposes any desired length of film). Optical finder with parallax tilting, automatic adjustment. Footage inside finder (showing film exposed). Angle finder (for pictures secretly at right angles). Multi speeds, 8, 16, 24, 64 pictures. Direct focus on film. Reverse crank (for "mixes"). Single picture device. Automatic opening gate, and many other unique features, making it the Finest Ciné Camera obtainable.

• • • IMMEDIATE DELIVERIES. • • •  
NO WAITING. **£98:10:0** EXCHANGES.  
WRITE TO-DAY. **HIRE PURCHASE.**

The "Large Miniature" Camera of the Future!

## **SUPER IKONTA 530/16**

### OUTSTANDING FEATURES:

- 1—Takes large miniature  $2\frac{1}{2} \times 2\frac{1}{2}$  pictures on  $3\frac{1}{2} \times 2\frac{1}{2}$  roll film.
- 2—Latest fine-focus rotating wedge coupled and built-in distance meter.
- 3—Special Compur shutter, 1 to 1/400th sec.
- 4—Coupled film winding, making double exposure impossible.
- 5—Instantaneous erecting and unique quick-action fittings.
- 6—Shutter release on top of camera with range-finder and direct optical viewer in close alignment.
- 7—All die-cast body built to fine precision standard.

- The "large miniature" camera of the future. •
- Zeiss Tessar f/3.5 Speed, Compur, 1 to 1/400th... **£25 5 0**
- Zeiss Tessar f/2.8 Speed, Compur, 1 to 1/400th... **£28 5 0**

★ ★ **WANTED**—Cameras in exchange for latest New Models.

★ ★ **EASY TERMS**—2/6 weekly any £5 camera, 5/- any £10 one, etc. ★

### ★ GUARANTEE ★

Every New Camera (any make) supplied by ourselves is sent with our free six months' Personal Guarantee. By completing the printed guarantee form supplied with every new camera you are automatically covered against any possible defect or fault whatsoever.

## TWO NEW CAMERAS

for High-class Serious Pictorial Work.

• We recommend the following two cameras for serious pictorial workers, giving perfectly composed, accurately focussed pictures of the highest quality.

### NEW

## Thornton - Pickard HORIZONTAL REFLEX

VERY SMALL.

SIZE 6 in. high  $\times 4\frac{1}{2} \times 4\frac{1}{2}$  in.

• ALL ESSENTIAL FEATURES FOR PICTORIALISTS •

LONG EXTENSION.

AUTOMATIC HOOD.

$3\frac{1}{2} \times 2\frac{1}{2}$  Thornton-Pickard Reflex, Dallmeyer f/4.5, latest steel-gear self-capping 1/18th to 1/1,000th, long plain extension (for portraits, close-ups, etc., no supplementary lenses needed), automatic hood with direct finder incorporated, hinged sky shade. Will take plates, cut films, film pack or roll film. Telephoto can be interchanged and all essential pictorial features..... **£8:15:0**

9-in. Telephoto 1/6.5, interchanging mount..... **£5 5 0**  
APPROVAL. EXCHANGES. HIRE PURCHASE.

## ENSIGN AUTO - RANGE

COUPLED RANGE-FINDER.  
RISE AND CROSS FRONT.

DIRECT FINDER.  
RADIAL FOCUS.

$3\frac{1}{2} \times 2\frac{1}{2}$  Ensign New Range-finder Roll Film, coupled range-finder, dead-accurate focussing, unique rise and cross front (for bulkings, unique portraits, etc.), hinged back, quick-loading, radial focus by quick lever, all inside, real leather covered. The perfect range camera. Ensign New f/4.5, in 1 to 1/100th new shutter..... **£7 10 0**  
Ensign New f/4.5, in D.A. Compur..... **£9 15 0**  
Zeiss Tessar f/4.5, D.A. Compur..... **£12 15 0**  
Ross Xpres f/4.5, D.A. Compur..... **£13 12 6**  
EXCHANGES. APPROVAL. HIRE PURCHASE.

★ ★ 7 Days' Approval of any new camera on the market. Post Anywhere. Exchanges. Instalment Terms. Write To-day.

• Six Months' Guarantee with Every New Camera •

## AMAZING LIGHT ROCK-STEADY DEAD SILENT

16-mm. New Ampro Bronze Super Projector, large f/1.8 super lens, 500-watt coiled-coil direct illumination, lamp built-in venturi patent tube (passing every lot of light through the condensers), booster large reflector, all movements, forward, reverse, stills, rewind, geared tilting head, high-speed rewind (just press the button, that's all); patent unique new shutter (absolutely flickerless synchro-mesh silent gears for perfectly noiseless running at any speed), central oiling device, unique "kick-back" claws (no wear on films at all), centralised controls all built in base. All thick bronze ripple. Guaranteed.

**£37:10:0**

Rueset Carrying-case.. **£1 10 0**

7 Days' Approval.

Write To-day.

## $3\frac{1}{2} \times 2\frac{1}{2}$ Zeiss Latest Precision IKONTA

Range-finder, coupled dead-accurate focussing, automatic erecting, automatic dual finder. The large-size precision camera of the future. Slips in the pocket easily. Takes 8 or 16 pictures on  $3\frac{1}{2} \times 2\frac{1}{2}$  films, obtainable anywhere. Sets a new precision large picture standard.

Brand new **£19:0:0**

Also 16 on  $3\frac{1}{2} \times 2\frac{1}{2}$  model f/5.5..... **£18:12:6**

## NEW IKONTA

16-on- $3\frac{1}{2}$  Zeiss Ikon Ikonta, automatic erecting, all inside precision, very small and compact, direct optical finder. Lovely camera for perfection.

Zeiss Novar f/4.5, New Compur **£7:2:6**

Zeiss Novar f/2.8, New Compur **£8:0:0**

Dear Sirs,

I have just returned from a 16 day trip in Switzerland, of course my Rolleiflex went everywhere with me, Eismeer trips, Woods, The Jungfrauoch ( ~~22000~~ 12000 feet up ) with its brilliant, blazing sunshine and impossibly white snows ) lakes, everywhere ..

The 120 exposures I made were all **absolutely PERFECT**, except two exposures only ..

These two were taken when I had left the Tempophot in the Hotel ...and had to guess !

Yours faithfully

"absolutely perfect"

WITH THE

# Rolleiflex

THE CAMERA THAT SATISFIES THE CRITICS

It shows you your picture full size and right way up, and when you click your shutter you know that your picture will appear exactly as you saw it in the focussing hood.

Rolleiflex construction provides for full parallax compensation. Its Compur shutter, speeded from 1 to 1/500th sec., T. and B., has one lever for setting and releasing. It is fitted with Zeiss Tessar f/3.5 lens. Takes 12 pictures on 8-exposure 3½×2½ roll film for 1/-.

# Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

## Women Technicians and Ciné Society Executives

By GEOFFREY BYRON.

**I**N a recent number of "The A.P. and C." a contributor draws welcome attention to the part that women now play in ciné society activities. The writer mentions the fact that several clubs possess women secretaries—but goes on to show an astonishing lack of knowledge concerning the more material work performed by women amateurs in various parts of the country.

True, mention is made of the fact that Miss Huggins (of the Finchley Amateur Ciné Society) is directing a 16-mm. "problem picture"; but the writer amiably asks, "Are there any other women club directors, I wonder?"

"I have yet to hear of a club 'camera-woman'!" is another disturbing quotation from the article, which finally remarks upon the "fugitive beauty" women have long lent to film production, and urges them *now* to "aim at making a worth-while intellectual contribution as well."

Remarks of this character tend to create the impression that intellectual women have not yet become interested in these great activities; whereas the truth is that women have worked on the production executives of amateur ciné societies since their early formation. It is on record that there were at least two women directors in the London A.C.A., whilst the A.W.C.S. (the *all-women* society) borrowed masculine assistance only for the time that its technical crew were undergoing instruction.

Round about the same time, the Film Guild of London and the East Anglian Film Guild—known as the "highbrow" ciné societies—each had women technicians on direction and camera work. And Florence Kelsey, of the East Anglian, only two years ago, was entirely responsible for the direction of "Blue Elegance," which was favourably commented upon in "The A.P." and elsewhere.

### Recent Activities.

Coming to more recent times, several women well known to amateur societies have had directorial experience. These include Irene Nicholson, Arabella Hayne, Nancy Bodington, Anita Gillow, Adriane Hanné and Joan Dunlop. Miss Nicholson's great effort was in "Beyond This Open Road" (initial item in a recent performance of the Film Society), which she directed with B. Vivian Braun for the London Film Art Group.

Arabella Hayne, member of the Film Art Group and of Independent Films, was on Mr. Braun's executive in "Exhilaration," and is one of two directors engaged on Independent's documentary of an Essex farm. Nancy Bodington was one of the directors of "Flight," recent production of the amateur Film and Photo League; whilst Anita Gillow's work in the unit of "Discord in A Flat" proceeded with that of Erle Broadbent, director-member of the F.I.M.A.

There is a marked tendency nowadays for young directors to work in pairs, not the least accomplished pair being Evelyn Spice and Alex. Shaw. These workers have now co-operated in the direction of four films of holiday cruises; and, what is more, they have had two of them shown by the North London Film Society. A similar high understanding of amateur possibilities is shown by Adriane Hanné and Michael Burke, who together directed "Revolt of the Fishermen" for Independent Films.

### Practical Assistance.

In other directions, but mainly in connection with camera work, women have shown their interest in the serious side of amateur ciné society activity. Most of the directors already mentioned have been through the hard school of practical filming, whilst in addition a fair number of others can claim to have been actually in charge of camera work on location.

The Co-operative Film Group, for example, recently voted three camera-girls and one assistant to work on topical subjects. And Jean Ross, Hon. Sec. of the Film and Photo League, not only has three or four experienced camera-girls attached to the League, but is herself an intelligent cinematographer.

Apart from these activities, women have been known to assist with "the lights," and in a number of additional ways have shown their aptitude for the more practical tasks of film work. Mrs. Bernard Vorhaus, to quote an outstanding

One of several women technicians engaged on club work, Arabella Hayne is here shown checking a sight for the film she is now directing. Miss Hayne became interested in amateur cinema whilst studying at the R.A.D.A., and is associated with other important productions.

case, does a vast amount of executive work in connection with her husband's 35-mm. productions, and is also working as continuity-girl in Sigurd Moir's latest film of industrial life.

### In General.

In the provinces, Judith Todd has done much to foster amateur film production by the Preston and other Film Societies; though she is greatly opposed to the existing tendency (current in certain quarters) for "trying to ape Hollywood." Miss J. M. Harvey, of the London Film Society, is another who has contributed to the effort for raising

the standard of amateur intentions. Miss Harvey, incidentally, is in charge of the renting arrangements for the Braun-Nicholson film, "Beyond This Open Road."

Finally, mention must be made of the services of club women in the field of writing. Only where they are practical workers have they been able to give reliable advice and to assist amateurs of both sexes to find greater enjoyment in their delightful hobby. Included amongst those who have written on both the practical and æsthetic sides of cinematography, are Arabella Hayne, Marie Seton (who has

worked with V. I. Pudovkin, author of "Film Technique"), Irene Nicholson and Nancy Cunard.

Nothing has yet been said of the many other feminine workers closely concerned with the real activity of ciné societies. This is in part due to the fact of their having worked with people whose names are more or less synonymous with their own. Thus we may remember Mrs. and Peter Le Neve Foster, Gladys Wright and Basil Wright; whilst the assistance rendered her husband, Robert Flaherty, by Mrs. Frances Flaherty is (probably!) too well known to need any mention in this place.

## Avoid Mechanical Troubles By S. E. L. MOIR.

The time-honoured advice to "leave well alone" is undoubtedly well meant; but when dust and film deposits threaten efficient working even the sweetest of adjustments must be disturbed. This article deals with effective cleaning, and draws attention to the more prevalent blunders of replacement.

AT this season of the year, dust and other accumulations within the camera necessitate its frequent cleaning. Sometimes, purely local attention with a dampened brush is sufficient to render the instrument safe for future use; but in other cases the conscientious amateur feels that a thorough overhaul is the only thing that will put the camera right.

There is no need here to say where one must look for the dust. It will, of course, be most obvious in or about the place where it was originally remarked; but deposits will also be found behind the toothed cylinders, between the gate and pressure pads, and on all surfaces not actually rubbed during loading or working. Such deposits should be removed with as little fuss and disturbance as possible, and always a camel-hair brush (moistened with water or methylated spirit) is preferable to a cloth duster; blowing, since it merely transfers much of the dust from one place to another, being rather less efficient than either of the wiping methods.

### Ruined Shots.

One very important point about all cleaning is the necessity that exists for properly replacing every piece of mechanism temporarily removed from the ciné camera. This was brought home to me very forcibly when a friend (ordi-

narily an exceedingly able ciné-photographer) recently exposed 200 ft. of stock on topical matter which I required to complete a documentary film. He had omitted to replace a tiny screw taken from the turret lens plate of his camera. The result, of course, was bad "fogging" on most of the shots; and only when light values fell to the equivalent of full f/1.5 was the trouble reduced to negligible proportions.

The loss of the stock is unfortunately the smallest part in most of these accidents (it is always the subject that counts most), but even so the saving in film stock is ample recompense for the little trouble involved in checking-up the replacement of parts removed.

Other pieces of mechanism that might possibly be omitted are the retaining screws on the toothed cylinders, the cylinders themselves and their "riders." All or merely one of these omissions would be sufficient to cause a seizure during the running of the film—with or without attendant film-scratch. The lazy-screw and the retaining catch of the gate may also prove subjects for possible omission. Here the effect would be to tear the perforations on one side of the stock, and certainly for the great majority of images to be right out of focus.

Out-of-focus effects may also be caused by a failure to preserve proper adjustment on the film-gate pressure pad.

This adjustment depends upon the proper manipulation of one or two screws—which, in most cases, are so situated that accidental movement can readily upset their somewhat delicate adjustment.

Whilst attending to these details, care must be taken that the back of the shutter blade is not in any way struck with the screwdriver or other implement being used to effect the adjustments. Similarly, when the lenses have been removed for cleaning, the front of the shutter and other exposed mechanism should be carefully protected by giving the turret the usual one-sixth of a turn to the locking position.

The spring-coil belts or gears that actuate the shutter and take-up mechanism are not as a rule entirely accessible or removable, but the cinematographer with an enquiring turn of mind should in any case avoid tampering with these—unless he be qualified to replace the parts exactly in the position they occupied before being disturbed.

Faulty synchronisation of the shutter and intermittent will yield not pictures but an unusable, blurred strip. The effect of a twisted belt on the take-up is obviously to rewind the stock wrong way round on the spool—and (not so obviously) to scratch the emulsion surface of the exposed film, especially towards the end of the reel.

## NEWSPAPER PHOTOGRAPHIC COMPETITIONS

WE have already referred to the competitions run by certain daily and weekly newspapers in which cash prizes are offered for amateurs' snapshots during the summer season. For the benefit of readers who missed the previous announcement, we give this list again. Those intending to compete in these competitions should obtain copies of the papers themselves, wherein they will find particulars of the competitions in full in each issue:

*Daily Herald* offers a cash prize of no less than £2,500 for a snapshot. This is probably a record for this type of competition and should attract an enormous entry. In addition to the big prize, there are unlimited two-guinea prizes that are given for snapshots reproduced daily in the *Daily Herald*. Additional prizes go to dealers who supply the materials, etc., of the winning prints.

*Daily Mail* is offering weekly prizes of £15, £10 and £5 in three competitions, (a) town snapshots, (b) country snapshots

and (c) seaside snapshots, with a final prize of £50 for the best photograph in each section at the conclusion of the competition.

*Daily Sketch* offers £1,000 for photographs of "bathing belles," with weekly prizes for the snapshots reproduced.

*News Chronicle* is holding a "Britain" contest, with prizes of £50, £25 and £10 in each of two sections: (a) Pictures of Picturesque old Britain; (b) Pictures of new Britain. Thirty shillings is paid for every photograph that is published, in addition.

*Sunday Referee* offers £50, £25, £10 and fifteen prizes of one guinea each for "Beauty snaps."

*Sunday Pictorial* offers £5, £3 and folding Kodak cameras as weekly prizes for "Happy snaps."

*Weekly Illustrated* has a competition for pictorial snapshots, and £100 will be paid for the best picture entered during the competition. £1 is paid for each photograph published. A monthly prize of £25 or a cruise for two is awarded also.

# Letters to the Editor

*The Editor is not responsible for the opinions of his correspondents.*

## AN ENLARGER PROBLEM.

SIR,—In reference to the complaints regarding the shadow which appears on the enlarging easel when using electric lamp, I think it will be found that this is caused by the lettering on the top of the bulb.

This may be ascertained by racking back the lens, when the shadow will become clearer, and eventually the operator will be able to read the inscription on the easel.

The above, of course, only applies when a diffuser is not used. The lettering can be removed with fine glasspaper.—  
Yours, etc., M. E. MUMMENY.

## COLOUR FILMS.

SIR,—As an enthusiastic colour worker, may I add my quota to Mr. J. H. Clark's article, "Snapshots in Colour," in your issue 10th July.

When using a Rollex roll-film adapter on my reflex the film is reversed, so, apart from the economic side, I, too, had to work out the positions of the pictures. I found the actual film measured  $20\frac{1}{4}$  in., and this divided by six gave exposures of  $3\frac{1}{2}$  in. for each picture (with a small space for separation). Also, when the hand was showing in the window no film was then facing the lens, so that  $3\frac{1}{2}$  turns then brought the first film into place;  $3\frac{1}{2}$  more turns for the second;  $3\frac{1}{2}$  more turns for the third;  $3\frac{1}{2}$  more turns for the fourth; 3 more turns for the fifth, and 3 more turns for the sixth, giving six exposures of equal size. This suggestion may be helpful to other photographers.—Yours, etc., (MISS) B. TANNER.

## EXPOSURE METERS.

SIR,—Your correspondent S. L. Carter seems to me to be inconsistent in his reasoning and in his criticism of A. J. Bailey's reckoning. I was always led to understand that in using a  $\times 3$  filter, the exposure, as indicated by a meter, had to be multiplied by 3; hence, it would follow that an exposure of  $1/100$ th with a  $\times 3$  filter would be  $1/300$  or  $1/333$ rd, just as A. J. Bailey states.

S. L. Carter, in his first calculation divides by 3, which appears to me to be wrong, while in his second he multiplies by 3, which seems right.

I should like to know who has really misunderstood the  $\times 3$  filter.—Yours, etc., A. H.

SIR,—Mr. A. J. Bailey replies in your issue dated July 3rd to a letter by Mr. A. C. S. Irwin, published under the above heading in your issue dated June 5th.

Mr. Irwin stated that an exposure of  $1/40$ th sec. at  $f/6.3$  with no filter is equivalent to about six times the exposure of  $1/200$ th sec. at  $f/4.5$  using a  $\times 3$  filter.

Mr. Bailey, on the other hand, tries to prove that there is

practically no difference between these two exposures, but he makes a *faux pas*.

If he will examine Mr. Irwin's statement he will find that the second exposure cited was  $1/200$ th sec. at  $f/4.5$  when actually using a  $\times 3$  filter. Had no filter been used the equivalent exposure would have been  $1/600$ th sec. at  $f/4.5$ , or about  $1/230$ th sec. at  $f/6.3$ .

Thus the first exposure quoted of  $1/40$ th sec. at  $f/6.3$  is about six times this second exposure of  $1/230$ th sec. at  $f/6.3$ , as originally stated by Mr. Irwin.

I think Mr. Bailey will see his mistake if he reads his own letter again now.—Yours, etc., FRED BICKSTONE.

## CONCENTRATED DEVELOPER.

SIR,—I was very interested to read the question of your reader, S. V. (Sheffield), and your reply concerning "concentrated developer" in a recent issue, as this confirms my own experience.

I made up some of this developer, which I find very useful, using half the quantities of first quality chemicals as stated in the article, rigidly following the technique given, but using a glass beaker in place of an enamelled saucepan. After the addition of all the potassium metabisulphite, no precipitate whatever was produced in the solution, even after standing at room temperature for two days.

The statement that a precipitate was formed led me to wonder if some chemical reaction had occurred of which I was unaware; but realising that the addition of alkali must be made, I then decided to add the caustic soda and use as an end point the reaction of the solution to a suitable indicator. This I found unnecessary, as the addition of a small quantity of the caustic soda solution produced a heavy white precipitate, which, after the continued addition of further caustic, increased in amount up to a point, after which it re-dissolved.—Yours, etc.,

JOSEPH PRITCHARD.

## EXPOSURES FOR FILMS.

SIR,—One day, whilst on a recent trip to Germany, I ran out of films, and on going to a near-by general shop I was shown a good selection of films for my size camera,  $6 \times 9$  cm. The film that I eventually bought caught my eye on account of its metal screw-top container. On opening it, I was surprised to find an exposure card computed for this particular film in the form so popular with Continental manufacturers, namely, the "adding-factor" system.

Could not this idea of exposure guide be carried out in this country? It would clear up once for all the manufacturers' problem of emulsion speed factors, since they need be concerned only with the exposure card enclosed with the film.

Incidentally, the film was enclosed in very thick single sheet tinfoil, and vibration was prevented by means of a tapered coil spring in the bottom of the tin.

On the back of the exposure guide was a guarantee, together with the serial number of that particular film.

The price of the film was the same as for the other makes of this particular speed— $26^{\circ}$  Scheiner,—i.e., 1 R. Mark.—Yours, etc., ALEC JAMESON.

# THE WEEK'S MEETINGS

*Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.*

## Wednesday, August 7th.

Rochdale P.S. Suggestions for Winter Syllabus.

## Thursday, August 8th.

Hammersmith H.H.P.S. Discussion on One-man Show. E. Orton.  
N. Middlesex P.S. "The Value of Outings."

## Saturday, August 10th.

Dennistoun A.P.A. Linlithgow.  
Cripplegate P.S. Epping Uplands.  
Exeter C.C. Helton and Steps Bridge.  
Hackney P.S. Chorley Wood to Chénies.  
Hanley P.S. Consall.  
Sheffield P.S. Ecclesfield and Whitley.  
Southampton C.C. Motor Boat Outing down Southampton Water.  
South London P.S. Dulwich. Meet at North Dulwich Station, 2.30 p.m.

## Sunday, August 11th.

Ilford P.S. Loughton to High Beech. Meet at Ilford Station, 10 a.m.  
Worthing C.C. Arundel.

## Monday, August 12th.

Oldham E.P.S. Tinting Demonstration.  
Southampton C.C. Beginners' Evening.

## Tuesday, August 13th.

Hackney P.S. Lecture by A. B. Richardson.  
Nelson C.C. Mounting.

## Wednesday, August 14th.

Leigh Lit. Society P.S. Winwick.

# Readers' Questions ANSWERED

**GENERAL.**—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

**CONTRIBUTIONS.**—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

**ENQUIRIES AND CRITICISM.**—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

## Angle of View.

How can I calculate the "angle" of a lens when the focal length of the lens and the diagonal of the plate are known? If I use a  $\frac{1}{4}$ -plate adapter in a 5x4 camera would this make any difference to the angle? J. P. J. (Carshalton.)

When the angle of lens is given by the makers it is based on the circle of effective illumination; but the working angle of a lens depends upon the size of the plate with which it is being used. If you use a quarter-plate instead of a 5x4 you are including a smaller angle. An easy way of arriving at the angle included is by means of a diagram. Draw a line AB equal to the diagonal of the plate. Bisect it at C, and erect a perpendicular CD equal to the focal length of the lens. Join DADB and measure the included angle ADB. This is the angle of view in the existing circumstances, although the lens may be capable of including a greater angle.

## Weak Prints.

The prints I make are inclined to be insipid compared with those of a D. & P. firm. How can I get the same crisp contrasts and distinct colouring? A. J. M. (Fulham.)

If you want to get stronger and more contrasty prints this is partly a question of the negative itself and partly of the paper used for the print. We do not quite know what you mean by "crisp" contrast nor "distinct colouring." If you make a print from one of your negatives and then get a print from the same negative by a professional firm, and send all three to us, we shall no doubt be able to tell you what is the cause of your trouble.

## Developing Roll Film.

I develop roll films by the see-saw method. Can I wear rubber gloves to prevent scratches from finger-nails, etc., or would unwanted chemical action result? E. S. L. (Didsbury.)

There is no reason why you should not wear rubber gloves during develop-

ment. It is usual to hold the films, not with the fingers, but by means of wooden or plated metal clips. You should learn to handle wet films without damaging them; you cannot always wear gloves.

## Glossy Surface.

Although I have been using a glossy paper you will see that the enclosed print looks very dull compared with those done by a dealer. Have I got the wrong kind of paper? H. S. (Leeds.)

The paper is all right, but the high glaze is only obtained by special treatment. The wet prints are put face down on glass or other suitable surface such as ferrotype plate, squeezed into perfect contact, and allowed to dry. They then peel off with a glass-like surface.

## Weak Negative.

I send a sample of the sort of negatives I obtain. Do you consider it suitable for enlarger purposes as regards density, etc.? A. E. M. (Ipswich.)

Although the negative is clean and full of detail we consider it decidedly on the weak side. Even for enlarging you would have to use a very contrasty or vigorous paper, and it is better to make negatives that will give good prints on a normal paper. You can get a much better range of tones. All you have to do is to increase your development time. Try carrying on development for half as long again as you have been giving, and test results until you learn by actual experience the best degree of strength and contrast to aim at in the negative.

## Subdued Background.

Herewith is an illustration from a newspaper. The chief figures are bright and clear, but all those in the background are subdued. Is this due to the lighting, or was the photograph taken by some special method? If so, how is it done? E. L. M. (Dover.)

Such effects are now very common. The object is to emphasise the principal

objects, but this is done at the expense of truth. The original photograph is very different; but rather dark colour is sprayed over the whole of it except those parts which are to remain bright. These are protected, by masks or otherwise, from the spray. In the form in which it appears in the print it is something for you to avoid rather than imitate, at any rate for ordinary pictorial purposes. As it stands, it is merely an artificial convention.

## Fixing Time for Prints.

With bromide paper I have been accustomed to leave prints in the fixing bath sometimes for at least half an hour. I now find that with chlorobromide this seems to weaken the prints. Is this only my fancy, or is it a recognised fact? J. B. (London.)

It is a fact, especially in the case of an acid fixing bath. Prolonged immersion tends to remove the delicate tones from a chloro-bromide print, and the maximum time in a normal bath should be about fifteen minutes.

## Persulphate Reducer.

I wish to treat some negatives with persulphate. Will you give me a hint or two as to procedure? A. F. (Rochester.)

You might make up a stock solution to Bennett's formula:

Ammonium persulphate ..	1 oz.
Sodium sulphite ..	2 oz.
Sulphuric acid ..	48 min.
Water to ..	10 oz.

The working solution is 1 dr. of stock solution to each ounce of water. Directly the action has gone far enough, rinse quickly, and give the negative two or three minutes in 10 per cent sodium sulphite. Wash well, and dry.

## Fixed-focus Camera.

My box camera has no focussing arrangement. How can I find the nearest distance for sharp definition at the largest stop, which is f/8? R. M. (Highgate.)

The details you give are insufficient. What is "sharp" definition? There are different standards. And what is the focal length of your lens? This is an important factor. You can get an approximate idea of the distance by taking the focal length of your lens in inches, multiplying the figure by itself, and calling the result feet. Thus, if you have a 4-in. lens the distance will be 16 ft. At f/11 it will be rather less; at f/16, less still.

## Over-printed S.T.P.

I sometimes print self-toning paper too far. Is there any remedy? A. A. (Salisbury.)

A certain amount of reduction can be secured by prolonged immersion in the hypo bath, but the colour suffers. A better plan is to put the print first in a potassium permanganate solution of a pale pink colour. This slowly reduces the image. Rinse the print, and proceed as usual.

## Clearing Bath.

Can you recommend a clearing bath for foggy bromide prints other than the usual cyanide one? L. E. (London.)

The following is safe and efficient:

Water ..	10 oz.
Thiocarbamide ..	20 grs.
Citric acid ..	10 grs.

# The AMATEUR'S EMPORIUM

## Business Notices Publishing

**OFFICES.**—Dorset House, Stamford Street, London, S.E.1. Telegrams: "Amaphot, 3edist, London." Telephone: Hop 3333 (50 lines).  
**PUBLISHING DATE.**—"The Amateur Photographer and Cinematographer" is on sale throughout the United Kingdom every Wednesday morning.  
**SUBSCRIPTION RATES.**—British Isles 17/4 per annum, Canada 17/4, other countries abroad 19/6 per annum, post free.  
**REMITTANCES.**—Cheques, etc., should be crossed and made payable to Iliffe and Sons Ltd. "The Amateur Photographer" can be obtained abroad from the following: **UNITED STATES:** The International News Co., New York. **FRANCE:** W. H. Smith & Son, 248, Rue Rivoli, Paris; Hachette et Cie, Rue Reaumur, Paris. **BELGIUM:** W. H. Smith & Son, 71-75, Boulevard Adolphe Max, Brussels. **AUSTRALIA:** Gordon & Gotch, Ltd., Melbourne (Victoria), Sydney (N.S.W.), Brisbane (Queensland), Adelaide (S.A.), Perth (W.A.), and Launceston (Tasmania). **NEW ZEALAND:** Gordon & Gotch, Ltd., Wellington, Auckland, Christchurch and Dunedin. **INDIA:** A. H. Wheeler & Co., Bombay, Allahabad and Calcutta. **CANADA:** Imperial News Co., Toronto, Winnipeg and Vancouver; Benjamin News Co., Montreal; Gordon & Gotch, Ltd., Toronto. **SOUTH AFRICA:** Central News Agency, Ltd.

## Displayed Advertisements

Communications on Advertisement matters should be addressed: The Advertisement Manager, "The Amateur Photographer and Cinematographer," Dorset House, Stamford Street, London, S.E.1. Copy for displayed advertisements for the issue of any particular week must reach Dorset House by the first post on Tuesday morning in the week previous. Rates and conditions will be sent upon application.

## Prepaid Advertisements

### SALE AND EXCHANGE: AMATEURS ONLY—

12 words or less ..... 1/-  
 1d. for every additional word.

### PROFESSIONAL AND TRADE:—

12 words or less ..... 2/6  
 2d. for every additional word.

Each paragraph is charged separately.

**SERIES DISCOUNTS** are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid and posted to arrive at the Head Office, Dorset House, Stamford Street, S.E.1, not later than first post FRIDAY for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 26, Deansgate, Manchester, 3; 23b, Renfield Street, Glasgow, C.2.

Advertisements are inserted, as far as possible, in the order received, and those received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders sent in payment for Advertisements should be made payable to **ILIFFE AND SONS LTD.**, and crossed

& Co.

Notes being untraceable if lost in transit, should not be sent as remittances.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

**BOX NUMBERS.**—For the convenience of advertisers, letters may be addressed to numbers at the office of this paper. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charges, which must include the words: "Box 000, c/o 'The Amateur Photographer'." Replies should be addressed: "Box 000, c/o 'The Amateur Photographer,' Dorset House, Stamford Street, London, S.E.1," and these letters will be simply forwarded by us to the advertiser. It must be understood that we do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisement. Readers who reply to Box No. advertisements are warned against sending remittances through the post except in registered envelopes. In all such cases the use of the "Deposit System" is recommended.

## Special Note

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

## Deposit System

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Amateur Photographer and Cinematographer," both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10 a deposit fee of 1/- is charged; on transactions over £10 and under £50 the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, one-half per cent. All deposit matters are dealt with at Dorset House, Stamford Street, London, S.E.1, and cheques and money orders should be made payable to Iliffe and Sons Ltd.

## CAMERAS AND LENSES

**31**×2½ Kodak Graflex, Kodak f/4.5 special lens, revolving back, F.P.A., velvet-lined case, and Goerz 60-mm. Tele-negative lens for use in conjunction with the Kodak f/4.5; all in very good condition, £8; approval deposit.—Akroyd, Albany Rd., Victoria Park, Manchester. [8519]

**SUPER** Ikonta 3½×2½, 8 or 16 pictures, Tessar f/4.5, D.A. Compur to 1/400th sec., de luxe case; scarcely used, £15; bargain.—Box 4873, c/o "The Amateur Photographer." [8651]

**1-PLATE** Soho Reflex, Ross Xpres, Telephoto, 6 4 D. slides, velvet-lined case, F.P.A., £16.—8, Caxton Avenue, Blackpool. [8653]

**A** GFA Speedex Roll Film Camera, 3½×2½, f/4.5 anastigmatic lens, Compur shutter, 1 to 1/250th sec., £3/3.—Apply, J. Armstrong, 1, Westbourne Terrace Rd., W.2. Telephone, Abercorn 3259. [8654]

**IKOFLEX** Twin-lens Reflex, Novar f/4.5, auto. focussing and film-winder, 3-speed shutter; in perfect condition; bargain, £5/5.—Patrick, 21, Moores Rd., Leicester. [8655]

**31**×2½ Ensign Reflex, slides, F.P.A., no lens; 2 almost new, £4.—Kille, Avenue, Minehead. [8657]

**ENSIGN** Reflex, f/4.5, with F.P.A., new condition, £7; F/4.5 Tropical Carbine 3½×2½, £3; or Exchange Prism Binoculars.—95, High St., Scunthorpe. [8658]

## WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

## CAMERAS AND LENSES

**ENSIGN** Roll Film Reflex, Aldis Uno f/4.5, focal-plane to 1/500th, leather case; new condition, £4.—Bullen, 136, Malden Rd., Chead, Surrey. [8659]

**ROSS** Xpres f/4.5, Saalex Focal-plane ½-pl., 9 slides, screen, 135/-.—71, Lovelace Gardens, South-end-on-Sea. [8661]

## CAMERAS AND LENSES

**RETINA** £10, 2 films, Panatomic, 1 zip bag; only used once, in perfect condition, £8.—Higson, Burnlea, Crossways, Gidea Park, Essex. [8663]

**41**×3½ Popular Pressman Reflex, 5½-in. Aldis-Butcher f/4.5, reversing back, 4 single slides; bargain, £3.—W. Cooper, 5, Grove St., Wilmslow, Manchester. [8666]

**31**×2½ T-P. Reflex Junior Special, Aldis f/4.5, 6 slides, F.P.A., stiff canvas case, Diaphot meter, filter; good condition, £6 or nearest.—Warner, Flint Cottage, Mount Ephraim Lane, S.W.16. [8667]

**L**ATEST Contax, Sonnar f/2, in ever-ready case, Triotar f/4 8.5-cm., Tessar f/8 2.8-cm. wide angle lens, view-finder for W.A. lens, lens hood, pan. and iso filters, all as new and perfect; list £75/12; sell £49.—10, Oakbank Grove, Herne Hill, S.E.24. [8668]

**1-PLATE** T-P. Special Reflex, f/4.5 Zeiss Tessar, 4 rising front, revolving back, 9 slides, F.P.A., solid leather case; all in almost new condition, £7/10.—Hobbs, Architect, Maidenhead. [8669]

**ERNEMANN** 6×9 cm., Ernon f/3.5, 3 plate-holders, 1 pack-holder; cost £27; £9, deposit.—69, Wymering Mansions, Maida Vale, W.9. [8670]

**REFLEX**, Ensign 2½×3½, f/3.4 Aldis-Butcher, reversing back, F.P.A., R.F.A., slides; perfect, £7/15.—Bowen, 5, Westland Rd., Wolverhampton. [8672]

YOU CAN DEAL IN PERFECT SAFETY THROUGH OUR DEPOSIT SYSTEM.

## CORRECT EXPOSURE

Price  
**57/6**  
Ever-Ready  
Leather Case,  
5/- extra.

Yours for 5/3 down and 11 similar  
monthly payments.

The New "AVO" Photo-Electric  
Cell Meter ensures Correct  
Exposure EVERY TIME

### EXCLUSIVE FEATURES

1. Equally suitable for "Still" and Ciné cameras.
2. Adjustment provided for plate and film speed.
3. Direct reading—no calculations whatever.
4. BRITISH MADE.

### What a customer says:

"Many thanks for prompt dispatch of the 'Avo' Meter. I have now tried this and am definitely keeping same. It is certainly superior to other meters costing considerably more. I enclose herewith cheque—having deducted the allowance quoted on my old meter, which, by the way, I consider very generous. (Signed) Dr."

(Original may be seen.)

See what your unwanted meter is worth. Let us make you a SUPER ALLOWANCE.

### DEALERS & PROFESSIONALS PLEASE NOTE!

We supply the "Avo" at full trade terms, immediate delivery.

### POST THIS TO-DAY.

Please send me full details of the 'Avo' Exposure Meter, in which I am interested. Also please quote me, without any obligation on my part, your highest Super Allowance on my present meter, which is a

## DEVELOP YOUR FILMS THE CORREX WAY

Even the comparatively inexperienced amateur who has hitherto given his films out for development will have no difficulty in obtaining equally good, and probably better, negatives at home by using a "Correx" tank according to the simple instructions.

"Correx" Roll-film Developer is available in packets containing just the right amount to make a developing solution to fill the tank. The "Correx" Thermometer is inserted through the lid of the tank and shows the temperature of the developing solution from the outside.

Correx Tank for Leica, Contax and Retina films.....27s. 0d.

No. 731. Correx Tank for V.P. films, 25s. 0d.

No. 733. Correx Tank for 2½×3½ in. films, 25s. 0d.

No. 736. Correx Tank for 2½×4½ in. films, 30s. 0d.

Correx Thermometer (Fahr.).....2s. 6d.

Correx Developing Powders, per carton of 6 pairs.....1s. 6d.

Ask your dealer to show you a "Correx."

# CONVINCED!

Read this unsolicited letter from  
**C. P. Vaughan, Esq.—"Kirkby"**  
—famous everywhere for his  
miniature photography.

Messrs. R. A. Fleming & Co., Ltd.,  
32, Lord Street,  
Liverpool. 24th July, 1935.

"Dear Sirs,—Just a line to say how pleased I am with the f/2.9 new Korelle camera I purchased from you recently.

"To be quite candid, when I bought it I had my doubts. The shutter I knew was good, and the body of the camera was obviously of sturdy construction and beyond reproach. How then, I thought, could the margin of so small a price include an f/2.9 anastigmat lens of anything like reasonable quality? This is still a mystery to me, and must be a closely guarded trade secret for, after taking several test exposures, I find that the lens leaves nothing to be desired, either in definition, covering power or speed.

"I congratulate you on supplying a long-felt want, and wish you every success in your new and splendid line."

Yours faithfully,  
(Signed) C. P. VAUGHAN.

We would like to convince you,  
too—write for Korelle leaflet.

condition, £7 or near offer.—Box 4917, c/o "The  
Amateur Photographer." [8724]

## THIRTEENTH EDITION

## WALL'S DICTIONARY

## of PHOTOGRAPHY

AND REFERENCE BOOK  
FOR THE AMATEUR  
AND PROFESSIONAL  
PHOTOGRAPHER

Edited and largely re-written by  
**F. J. MORTIMER, Hon. F.R.P.S.**

All the latest photographic  
principles are incorporated in  
the present edition, which  
includes up-to-date informa-  
tion on such recent develop-  
ments as infra-red, high-speed  
and colour photography. The  
volume provides practical in-  
formation in dictionary form  
on every phase of the subject  
—technical, pictorial, scientific  
and general, and is in itself an  
explanatory index to all terms,  
formulæ, etc. Its contents are  
made readily accessible by the  
extensive use of cross refer-  
ences.

CLOTH BOARDS.  
CROWN 8vo.  
645 PAGES.

PRICE 7/6 NET By post 8/-

Dorset House

Stamford St., London, S.E.1

The best  
Photo  
Corners!

## "TRANSPAROL"

are made of pure "Cellophane" (Reg. Trade Mark), and not cheap imitation material. They are invisible, and show the picture up to its extreme edges. 6d. per box of 100.

*They do not stick together and ruin the snaps like those of inferior makes.*

## "FAVORIT"

are handsome opaque corners, easily and quickly fixed in position. Very ingenious—they make snapshot albums very beautiful—and eliminate the bugbear of messy paste pot and brush. Made in Sepia, Grey and Black. 6d. per box of 100.

## FROM YOUR DEALER

Manufactured by Hermann, Stuttgart.

### Trade.

**6/-** The Illustrachrome Multi-colour Wheel will enable you to give your movies in a fully professional manner by introducing delightful chromatic and atmospheric effects. You can present your feature opening with a blaze of glorious multi-tinting and then throughout the subject create a sense of reality that you have never before enjoyed. Then at the end pass from sunset to twilight in restful conclusion, you will be more than satisfied with the knowledge that you have given a perfectly artistic presentation by employing this aid to better movies. To fit all projectors, including the B-200, 6/-—An Illustra product.

**ILLUSTRA-LIGHT** Set for Pathe Baby Projectors will enable a 6-foot picture to be shown with ease; no heat problem in spite of brilliance secured.

**THIS** Illustra offering uses a new type lamp and highly-efficient reflecting device, new type condenser and the whole in a lantern of same diameter as original, 1-in. longer; fitting takes but a few seconds. This set is supplied in 3 models: Type A, for use with 12-volt accumulator, 40/-; Type B, for use with A.C., 60/-; Type C, the universal model for A.C. or D.C., 65/-—An Illustra product.

**EVERYTHING** for Movies.—Cameras Projectors, Films, Screens.

**NOT** a Shop, a warehouse packed with cine equipment; no catalogue is available of bargains far too numerous to list, therefore, if in London, your inspection is invited.

**ILLUSTRA ENTERPRISES**, one address only, 159, Wardour St. (facing Film House), Oxford St. End, London, W.1. Ger. 688C. [8266]

**CINEMATOGRAF** Films, Accessories, standard only; list free; sample 1/-—Filmeries, 57, Lancaster Rd., Leytonstone, E.11. [6822]

**35-MM.** Panchromatic Cine Film, best makes, 10/6 100 ft., also longer lengths; all accessories, developing and printing; let us know your requirements.—B. S. Productions, 1, Mitre Court, Fleet St., E.C.4. Telephone, Central 2480. [8649]

## LANTERNS & ENLARGERS

**ENLARGER**, Lancaster Condenser, Dallmeyer f/4.5, V.P. to 12x10, for gas, cost new, £4/7/6, take 30/-; Kodak R.F. Tank, 7/-; Two new Bakelite Whole-plate Dishes, 3/- each; take £2 lot. Rea, 25, Lawden Rd., Small Heath, Birmingham. [8660]

**LANCASTER** Vertical Enlarger (condenser), 3½x2½ masking negative carrier, cost 62/6 in February, in conjunction with 3a Folding Kodak (combination back), f/8 in B. & L. shutter (camera is minus view-finder), 50/-—J. J. Byers, 59, High St., Lockersbie. [8688]

### Trade.

**Optochrom**
**LIGHT FILTERS**  
**FOR PANCHROMATIC EMULSIONS**

 OPTOCHROM LIGHT FILTERS are made of  
 optical glass coloured throughout its entire mass  
 during manufacture. They are not therefore  
 affected by heat or damp, as are gelatine filters  
 mounted between glass.

 OPTOCHROM UNIVERSAL GREEN GLASS  
 FILTERS are recommended for use with Panchro-  
 matic or Orthochromatic Plates or Films of all kinds  
 for daylight exposures.

 OPTOCHROM BLUE GLASS FILTERS are recom-  
 mended for artificial light exposures with Panchro-  
 matic material.

 OPTOCHROM RED GLASS FILTERS are recom-  
 mended when extreme contrast is required from  
 Panchromatic Plates or Films, also for Infra-red  
 emulsions. Exposure factor, 6 to 10 times for day-  
 light, 30 times for Infra-red emulsions.

Prices, in adjustable Holders, with case.

THE LEADING MOTORING JOURNAL

# The London Salon of Photography

## 1935.

*SENDING-IN DAY, Wednesday, September 4th.*

THE TWENTY-SIXTH EXHIBITION promoted by the Members of the London Salon of Photography will be held at The Galleries of the Royal Society of Painters in Water Colours, 5a, Pall Mall East, London, S.W.1, from SATURDAY, 14th September, to 12th October, 1935.

**CONDITIONS OF ENTRY.**

No. 1. Pictures from exhibitors in the British Isles must not be framed; but may be mounted. Each picture must bear on the back, clearly written, (a) name of artist; (b) number and title of picture; corresponding to particulars on the Entry Form.

No. 2. When mounts are employed, they should conform to the following sizes— $25 \times 20$ ,  $20 \times 16$ , or  $15 \times 12$ , but no mount to exceed  $25 \times 20$ ; and it is suggested that white or light-toned mounts be employed wherever possible.

No. 3. Pictures from abroad must not be mounted (or framed), but should bear full particulars as above.

No. 4. Pictures which are sent unmounted will be suitably mounted by the Salon Committee, and all accepted pictures will be shown under glass.

No. 5. All pictures should be sent by parcels post, packed flat, and properly protected with stiff cardboard and adequate wrappings, addressed to: THE HON.

SECRETARY, THE LONDON SALON OF PHOTOGRAPHY, 5A, PALL MALL EAST, LONDON, S.W.1.

No. 6. The sending-in day is Wednesday, September 4th, 1935. All pictures for the Exhibition must arrive at the above address on or before this date. Exhibits may be delivered by hand at the Gallery on this date only.

No. 7. The Entry Form, properly filled in, must be sent with the pictures, together with entry and packing fee of 5/- (this fee covers any number of pictures from one exhibitor).

No. 8.—To avoid Customs complications, all entries from without the United Kingdom must be sent by post and without prices marked on the prints. Packages containing such entries should be clearly labelled: "Photographs for Exhibition Only. No Commercial Value. To be Returned to Sender."

No. 9. All pictures sent by post will be repacked and returned carriage paid, after the close of the Exhibition.

No. 10. In view of application being made from time to time to The London Salon of Photography for permission to reproduce pictures from the walls of the Gallery, exhibitors are asked kindly to signify on the Entry Form whether they have objection to such permission being given. The copyright, in all cases, remains the property of the authors of the prints.

No. 11. The Committee assure intending exhibitors that the utmost possible care will be taken of all work submitted, but they do not accept any responsibility for loss or damage, either during transit or at the Gallery.

The submission of pictures will be understood to imply acceptance of the above conditions.

Due notification of acceptance of pictures will be sent out as soon as possible.

All work submitted to the Selection Committee will be carefully and impartially considered, and no preference will be given to pictures by Members of the Salon.

Entry forms and further particulars from the Hon. Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.

# The AMATEUR <sup>3<sup>D</sup></sup> PHOTOGRAPHER

& CINEMATOGRAPHER

~ The Journal for Everybody with a Camera ~

Vol. LXXX.

Wednesday, August 14th, 1935.

No. 2440.

ENSIGN MIDGET

"No holiday complete without it"

ENSIGN, Limited, HIGH HOLBORN, LONDON, W.C.1

*Let's talk about*

No. 1 of an explanatory series describing the finest all-purpose film in the world

## DOUBLE COATING

'Panatomic' Film is coated with two sensitive emulsions: one fast, the other slow. The fast emulsion is quick to pick up shadow detail; the slow to retain high-light detail. Together they assure balanced exposure throughout, a long scale of gradation, and wide latitude

Besides the two coatings of sensitive emulsion there is a super-coat of gelatine to protect the emulsions from injury by scratches, etc. On the back of the film is a green anti-halation coating. This absorbs stray light that would otherwise be reflected back from the film into the emulsions, causing light-spread and blurring round light objects.

NEXT WEEK . . . COLOUR SENSITIVITY

(a)

(b)

(c)

- (a) Fast Emulsion prevents this black, sooty effect by helping to prevent UNDER-exposure.  
 (b) Slow Emulsion prevents this weak, washed-out effect by correcting OVER-exposure.  
 (c) The two combined give you this clear, crisp picture, fine in gradation and rich in detail.

KODAK LIMITED, KODAK HOUSE, KINGSWAY, LONDON, W.C.2

## PAILLARD CAMERA

(Made by the makers of PAILLARD-BOLEX Projectors.)

This camera marks a tremendous widening of scope for the 9.5-mm. film user—combining as it does, the low price advantage of 9.5-mm. film with camera refinements hitherto only obtainable with 16-mm. apparatus.

Here are a few of its many advantages :

- 1 SEMI-AUTOMATIC DAYLIGHT LOADING of spools, 50 and 100 ft. (any make).
- 2 SEMI-CIRCULAR TURRET HEAD of entirely new design, avoiding bulk. All leading makes of lenses can be used.
- 3 PICTURE PER PICTURE DEVICE for trick work. Exposures from 1/10th to 1/100th. Camera will make fades, superimpositions, lap dissolves, etc.
- 4 TRI-FOCAL TUBULAR VIEW-FINDER with accurate correction of parallax down to 2 ft.

PRICE : Model H.9, for 9.5-mm. films, with Dallmeyer f/2.9 lens.. **£49** Model H.16, for 16-mm. films, with Dallmeyer f/2.9 lens.. **£49**

# CAMERA AT "CITY SALE"!

## INSTRUMENT from our WONDERFUL SELECTION

Our stock includes cameras, ciné apparatus, tripods, lens hoods, filters, and everything you are likely to need to make your holiday photography really perfect.

### Super Sport DOLLY

Model C takes both sizes  $2\frac{1}{2} \times 1\frac{1}{2}$  and  $2\frac{1}{2} \times 2\frac{1}{2}$  on roll film, also plates  $2\frac{1}{2} \times 1\frac{1}{2}$  ( $4\frac{1}{2} \times 6$  cm.), with focusing on focussing screen. Clip-on slides. Reverse spooling giving possibility of using alternatively films and plates, and of interspersing exposures of  $2\frac{1}{2} \times 2\frac{1}{2}$  and  $2\frac{1}{2} \times 1\frac{1}{2}$  on the same spool. With Meyer  $f/2.9$ , Compur shutter. £10 10 0  
With Schneider Xenar  $f/3.9$ , Compur shutter. £12 12 0

### OMBRUXMETER

The photo-electric light-cell exposure meter. Gives dead-accurate exposures.

For still cameras. £4 4 0

### 'BLENDUX'

For ciné work £4 4 0

Either model on 9 equal monthly payments of 9/11.

### 'BRILLIANT'

Takes the standard  $3\frac{1}{2} \times 2\frac{1}{2}$  8-exposure roll film at  $1/100$ , but gives 12  $2\frac{1}{2}$ -in. square pictures. The brilliant image shows almost full size. With Compur shutter. High-grade  $f/4.5$  Skopar lens.

£5:15:0

Nine monthly payments of 13/6.

### SALEX CINÉ TRIPOD

Made of duralumin for strong wear. Light and compact for carrying. The legs are stout and rigid. Fitted with screw clamping device and panning and tilting device.

£5:15:0

Nine monthly payments of 13/6.

### LEICA MODEL III

With  $f/2$  Summar Lens, in collapsible mount. Gives exposures of  $1/100$ ,  $1/200$ ,  $1/500$ th sec. Automatic focussing, 3 shots in 10 secs., anything up to 36 pictures one loading, double exposures impossible. For holidays, travel or for photographs at night or in any weather, Leica is the ideal camera.

£39:10:0

Nine monthly payments of 82/2.

### EVERY ACCESSORY FOR THE LEICA ALWAYS in STOCK

### SPEEDEX-COMPUR

$3\frac{1}{2} \times 2\frac{1}{4}$

### ROLL-FILM CAMERA

The latest Agfa production. A good all-round holiday camera at a very popular price. In stock at all "City Sale" branches.

Light, convenient to handle, and possessing all the requirements of a modern folding camera. With Compur shutter speeded 1 to  $1/250$ th sec. and  $f/4.5$  Apotar lens. £6:6:0

Nine monthly payments of 14/9.

## ONE-NINTH DOWN SECURES

### Saalex BALDA

16 pictures on  $3\frac{1}{2} \times 2\frac{1}{4}$  roll film.

Metal body, D.V. finder, leather covering, nickel fittings. As illustrated, but with  $f/2.9$  Meyer lens. delayed-action Compur sector shutter, 1 to  $1/300$ th sec. £9:5:0

Nine monthly payments of 21/8.

### ROLLEICORD

Has numerous special features in common with the famous RolleiFlex—One-lever Compur shutter, parallax compensation, patent film guide. Zeiss Triotar  $f/4.5$  lens.

£10:10:0

Nine monthly payments of 24/6.

ENSIGN 'AUTOKINECAM' With  $f/3.5$  Dallmeyer anastigmat lens.

Enables even the beginner to obtain splendid 16-mm. movies. Beautifully made and finished. With clockwork motor, three speeds and hand crank, direct drive. Complete in leather case.

13 Gns.

Nine monthly payments of 31/10.

Why do critical photographers prefer the-

# Rolleiflex

Because . . .

12  
PICTURES  
FOR THE  
PRICE OF  
8

It combines the advantages of the finest modern reflex and roll-film cameras. Its pictures are equal to the highest reflex quality, and these are obtained with the cheapness and convenience of roll films. Rolleiflex takes 12 pictures on  $3\frac{1}{4} \times 2\frac{1}{4}$  8-exposure roll film for 1/-. The square pictures are a great advantage as they can be enlarged or trimmed to any required shape. Rolleiflex shows your picture full size and right way up, and focussing, shutter speed and lens stop can be seen all the time.

The same lever sets and releases the Compur shutter, which is speeded up to 1/500th sec., T. and B. Rolleiflex is the easiest of and fastest manipulated of all miniature cameras—it will take 12 shots in half a minute. Parallax compensation ensures that what you see you get! Fitted with f/3.5 Zeiss Tessar lens. . . . . £22 10 0

Vol. LXXX. No. 2440.

JUDGING by our own letter-box, this is the hey-day of the year for picture postcards. They come from all quarters accompanied by a few commonplace and self-absorbed lines, to the effect that this is a delightful spot, that the weather is lovely, that the sea is blue, that the fields are green, that excursions have been taken here, there and everywhere. How poor in personality the postcards are, as a rule. The stock sentences match the hackneyed view—or the other way about, as you like it. If only these people who are enjoying themselves so hugely would have postcards made of their own pictures—and, of course, they are taking pictures, because everybody is—and send these to their friends, how much such correspondence would gain! Probably the fact that it was their own picture would stimulate them to be a little more original in the space on the postcard left for correspondence. It would certainly save the postcard from going into the wastepaper basket, and would evoke in the recipient some sentiment of a kind which the ordinary purchased postcard nearly always fails to elicit. Convention has settled upon postcard size as the most suitable one for correspondence, and it is also a very suitable size—if not the most suitable—for one's pictures.

### The Seal of Satisfaction.

A last visit to the Royal Academy just before closing day discovered the red label on about 260 of the 1,700 exhibits. Which, considering the depression of the times, and the low level of artistic appreciation, is not to be "sneezed at." But it is not the total of sales, it is the choice which is really interesting.

## TOPICS of the Week

### A Weather Forecast FOR THE WEEK

By D. K. BARTLETT.

#### THURSDAY, AUGUST 15th.

While remaining warm and fairly bright, a good deal of cloud is probable, with thundery weather during the afternoon over parts of the Southern Counties of England and Northern Ireland.

#### FRIDAY, AUGUST 16th.

Continuing warm and fine, but it may become dull and rather overcast during the afternoon, also some showers are quite likely to occur.

#### SATURDAY, AUGUST 17th.

Fair intervals, some cloud and quite warm temperatures, although inclined to be cooler in the South of England than of late. A few showers across the hilly districts are probable.

#### SUNDAY, AUGUST 18th.

A somewhat changeable day, giving varied opportunities for different types of photography. An early breeze will develop, causing it to be cooler, and tending to give a fairly clear atmosphere.

#### MONDAY, AUGUST 19th.

Similar conditions are probable during the day, becoming unsettled towards the latter part of the afternoon, causing some dark clouds which may lend themselves to good photographic effects. Scotland should remain fairly warm and fine.

#### TUESDAY, AUGUST 20th.

Continuing breezy, with fair periods in the Southern Counties and across the Midlands. The coastal seaside resorts are likely to have some choppy to somewhat rough seas in the exposed places, which may give opportunities for wave and cloud views.

#### WEDNESDAY, AUGUST 21st.

It will be still rather changeable and disturbed, but now will slowly improve, and warmer temperatures are likely, giving rise to a softer light and probably some misty conditions off the East Coasts and through Scotland.

It suggests that while people in general like to see vivid paintings in a gallery, they prefer to live with something quiet—the grey angel rather than the scarlet woman. It is not so much the oil paintings as the drawings, the engravings, the etchings that sell. Some of this black-and-white work was sold six times over, much of it three or four times over. Even among the oil paintings purchasers seemed to have a preference for subdued tones. What is probably the highest-priced oil painting in the whole exhibition, for which £1,500 has been asked—and obtained, for it bears the "sold" label—is a work entitled "Zeitgeist," which has no splashes, but a wonderful delicacy in its low tones. The cardinal's robes, the academic hoods, the duchess's frocks are quite wonderful in the gallery, but at home——!

### The Building of To-morrow.

If the Architectural Room of Burlington House is any indication of what we may expect in the next generation or so in the way of public and private building, architectural photographers, who have concentrated rather on old churches and castles, and cottages that were thatched ones, will have occasion to adjust themselves to new angles. There will be quite astonishing transformations of the suburbs. The pretty, pretty box-like type of house will disappear in favour of sweeping blocks of flats which look for all the world like ships with projecting galleries, these being the balconies where the flat-dwellers get the sun. It is also a good sign that while in our own young days no one ever thought of giving any architectural expression to a post office or a railway station or an

elementary school, the artistic people have now got away with it, and here in this architectural room, in addition to the show-rooms of a gas company, a garage, a sorting office, and a telephone exchange, there are the drawings of three exquisite public-houses and three equally exquisite police stations. It will presently be an artistic experience to get "run in."

### The Portrait.

The presentation portrait shows no signs of decline. On the contrary, when we visit annually certain professional institutes and halls of companies and colleges and the like we observe another portrait added to the walls—the newly-retired president or master or whomsoever it may be. But is it the influence of photography which brings about a change in these presentation portraits as compared with those of

generations back, or is it just the effect of our speedier age? To-day the sitters give a suggestion of restlessness. We saw a portrait the other day in which the gentleman was portrayed sitting on the edge of a chair, his walking-stick in one hand and his gloves in the other, and we really expected that after we had turned round he would get up and walk out of his frame—a tribute to the realism of the painter, but perhaps even more an indication of the restlessness of the sitter. The subjects of these presentation portraits must now be making a speech all the time, or writing in furious haste, or tinkering with something. Not the ladies, it is true. It is part of their profession to look restful and languorous. But the men seem to want to be up and doing, as though they were all murmuring to the wielder of the brush, "Why don't you have a camera and get it over?"

### Filming in the G.P.O.

One of the most energetic film units in the country was that attached to the old Empire Marketing Board, and it is good to hear of its continued activity under the auspices of the General Post Office. Since being taken over it has produced many synchronised films (that is, picture and sound), and also silent films, and various "shorts." One of the silent films which we saw some time ago is a very ambitious and useful piece of work, showing the installation and working of the automatic telephone service. It bears the title "The Coming of the Dial," and certainly brings home to us this modern miracle. Not only so, but it has great pictorial merit, and makes ingenious and decorative use of lines and angles, giving the poetry of the telephone achievement as well as its prose. But will the "dial" itself be superseded?

## READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with on this page week by week. Other replies appear as usual on the last page.

### Shutter Testing.

*I am rigging up a shutter-testing gadget with a pendulum swinging seconds. I know the divisions of the arc are not equal, but how can I arrive at them?* F. R. W. (Clacton.)

You have to remember that the pendulum is at rest at each end of its swing, and that its highest velocity is at the middle point of the arc; hence the divisions must be so made that the time taken by the bob to pass any one of them must be the same.

The diagram shows a method of procedure, but to make it clear it has not been drawn to anything like the actual proportions, the swing being exaggerated in proportion to the length of the pendulum.

The points X and Y indicate the limits of the swing, and the arc between them has for its centre the point from which the

pendulum swings. Draw a straight line joining X and Y, and from its centre, with radius to X (or Y) describe a semi-circle. Divide this semi-circle, by trial, in any convenient number of parts. From each point draw a line perpendicular to the line XY, and continue it till it meets the arc of the swing.

In the diagram twenty divisions are shown, so that the pendulum will swing through one division in  $1/20$ th of a second; four divisions would indicate  $1/5$ th of a second; half a division  $1/40$ th; and so on. For the more rapid speeds, further subdivisions should be made.

It is advisable, when testing the shutter, to make the exposure when the bob is near the middle of the swing rather than the ends. In the latter case, with a slow exposure, the bob may traverse the same part of the arc twice.

### Stripping a Negative.

*Is there any reliable way of stripping films from glass negatives without using hydrofluoric acid? I should like to treat several negatives in this way, but do not like using the acid.*

F. F. (Runcorn.)

We believe it was Mr. John Sterry who first suggested a method which has often been used with complete success.

Make up a fifty per cent solution of potassium carbonate, and then mix one ounce of this, half an ounce of glycerine, half an ounce of formalin (40 per cent) and 25 ounces of water. This is a cloudy solution, and must either be filtered or allowed to stand and the clear liquid decanted.

In this solution the negative is placed dry, and allowed to soak for half an hour. It is then removed, surface dried with a soft rag, and put to dry in a cool place. Drying may take twelve hours or more.

With a steel rule and a sharp penknife cut through the film down to the glass all round, say an eighth of an inch from the edges. Insert the point of the knife under a corner of the film, which will easily leave the glass. Lay it face downwards for a few hours, and it can then be used in the same way as an ordinary film negative, although on account of its thinness it needs more careful handling.

# THE EXTRA HOUR of SUNLIGHT

In this article it is shown how the longer sunny days may be turned to account by the photographer in a variety of ways, and with different subjects. Some technical hints are also given.

THE amateur photographer at this time of year has cause for thankfulness for two reasons. There is the extra hour of summer light, and there are also plates or films of super speed, and lenses of wide aperture. These, in combination, permit of photography being carried on until quite late in the evening, and allow of the photographer taking advantage of those effects of late evening sunshine that are often much more attractive than those at any other time of the day.

## Evening Sunshine.

These evening sunshine effects can be employed for a great variety of subjects. In landscape or woodland there are abundant possibilities, and especially towards sunset, when shafts of sunshine provide accents which transform commonplace material into subjects worthy of any pictorial worker. It is a fact that many subjects are found under these conditions which would not be worth a glance at any other time. The interest in most cases centres in the foreground, where the play of luminous light forms attractive patterns.

## Portraits.

Portraiture in sunshine attracts many photographers, but the results are frequently disappointing. During the later hours the lighting is not as strong, and the softer character not only produces better modelling on the faces of the sitters, but the strained expression of the eyes that is so often seen when out-of-door portraits are taken during the brighter hours is avoided. The sunshine during the late evening is quite strong enough for photographic needs, especially if super-speed panchromatic materials are employed.

In such cases it is well to arrange the subject so that the lighting comes from behind and the sitter

is outlined by sunlight. This type of illumination is very effective for child subjects taken under natural surroundings. It is often possible to place the model in sunlight, against a background that is in shadow.

## Architecture.

Architectural subjects often pass from the plane of mere records and are endowed with pictorial interest, through the introduction of sunshine. The present practice of allowing many of the larger abbey and cathedral churches to remain

open to visitors until a late evening hour will be hailed with thankfulness by all keen photographers. It is very easy to find subjects in these buildings, upon sunny summer evenings; which could be taken at no other time. When the sun is due west, these buildings are often flooded with soft light and many delightful effects are presented.

The photographer at the seaside, or who has access to dockland, should not neglect the possibilities of the late evening hours. With regard to the technical aspect of late evening photography an exposure meter should be regarded as essential.

The lighting conditions are such that it is very difficult to estimate exposures accurately, even after considerable experience. While the light appears strong to the eye, it is of lessened actinic power, and there is often a large proportion of shadow, often more shadow than sunshine. These shadows need full exposure if they are to be rendered successfully.

## Plates and Films.

Fast plates or films should be used, preferably super-speed panchromatic material. This can cope successfully with lighting which is inclined towards yellow or red. Films of the 'chrome type are quite successful. When developing, care should be taken to keep the negatives of contrasty subjects on the thin side, or the high-lights may be hard and unprintable. This applies especially to portraiture under evening sunlight conditions.

To make sure of the best possible final result, careful attention must be given to the print. A paper must be selected that will render the soft lights and the transparency in the shadows that are characteristic of so many evening pictures.

*A typical seaside snapshot. A low viewpoint to bring the figure clear against the sky is advisable for this kind of subject.*

# Take your Camera to CAMP

By SYDNEY MOORHOUSE.

THERE are few forms of holiday so rich in subjects for the photographer as one spent under canvas. Whether your camp be of the mobile or fixed variety there is no dearth of material to work with, and a splendid opportunity for both scenic and human interest pictures.

The freedom from restraint which is the camper's lot is an advantage. He can spend more time in finding the correct and best viewpoint, and can stop when and where he chooses. Further still, his day-long intimate contact with the open places him in the position of being able to make his pictures just when the light is most suitable for his purpose.

The amateur photographer who camps with friends should take every opportunity of introducing them into his pictures. There are so many amusing and laughable incidents which happen daily in camp life, and should be recorded if the collection of holiday pictures is to be complete.

In order to make a success of pictures of this nature it is imperative that you should avoid "posed" photographs. Most people seem to be subject to a kind of "camera fright" and assume the most awkward

*Making light of one of the less pleasant tasks of camping.*

positions when they see the lens focussed upon them. A good way of getting rid of this is to exhibit your camera so often that in time your friends become so used to its presence that they take no notice of it, and thus afford you some excellent opportunities for unique pictures.

The lone camper would appear to be rather at a loss for introducing the human element into his pictures, but this difficulty can be overcome by either the acquisition of a camera with a delayed shutter or one of the automatic exposure devices which can be obtained for about five shillings. These are quite simple to work. The camera

is fixed upon a convenient ledge or a tripod and focussed. The automatic device is then fixed so as to allow sufficient time for the user to get into the picture.

The camper's camera should be one which can be carried about easily, so that the folding variety will be found more convenient than the fixed type. The best instrument for camp use will be found to be of the folding variety with direct-vision finder and taking snapshots of  $3\frac{1}{4} \times 2\frac{1}{4}$  in.; lens, f/6.3 anastigmat; shutter, three-speed,  $1/25$ th,  $1/50$ th,  $1/100$ th.

Great care should always be taken to see that the camera is never left lying about on the grass or inside a tent. Keep it inside a case when not in use, and you will also find that the best storage place is that where the camp food is kept.

Remember that landscape pictures are best when a filter and time exposure are employed, and that many scenes gain an added charm if they are not taken in brilliant sunshine. Early morning and late afternoon will be found the best times for this type of work, as the long shadows and softer lighting are helpful in bringing out the texture of the picture.

This, of course, means that a tripod should form part of the kit, although there are now on the market small clips which can be screwed on the bottom of the camera and a fence or tree thus used to support the instrument.

Campers have also a fine chance of obtaining some pictures of sunset silhouettes, made by setting a friend between the camera and the setting sun and giving an ordinary snapshot exposure.

*In the trough of Bowland.*

# For needle sharp pictures in all weathers . . . at all speeds . . . in all lights . . . you will always find a **CONTAX**

## POINTS OF SUPERIORITY

- All-metal focal-plane shutter, speeded from  $\frac{1}{4}$  to a real  $\frac{1}{1,000}$ th second; speeds altered both before and after setting.
- Long-base rotating wedge distance meter, ensuring a focussing accuracy not equalled even by the best reflex cameras.
- The Zeiss Ikon new patent wedge distance meter is coupled with the lens focussing. The "wedge" distance meter is not only more accurate, but also more robust than the usual type with movable mirror.
- Choice of 12 Zeiss Contax lenses, focal lengths from  $1\frac{1}{4}$  to 20 in., apertures from  $f/1.5$  to  $f/8$ . All lenses can be fitted interchangeably, and 8 are coupled with the distance meter.
- The back of the Contax is detachable for cleaning—an important point, because dust and particles of film emulsion will collect inside a camera and must be removed, otherwise negatives will suffer from pinholes.
- No external parts rotate during exposure; impossible therefore to spoil pictures by inadvertently touching moving levers.
- Handsome shape, rectangular with rounded corners; easy to hold steadily.

We publish three books, "The Connoisseur and the Contax," "Accessories for Contax Photography," and "The Ten Contax Lenses." Any or all of these books are available free of charge on request. Zeiss Ikon photographic products are obtainable from most good camera shops.

## PRICES :

With Zeiss Tessar $f/3.5$	£31 0 0
With Zeiss Tessar $f/2.8$	£33 15 0
With Zeiss Sonnar $f/2$	£41 0 0
With Zeiss Sonnar $f/1.5$	£56 5 0

Can be purchased from most good camera shops on the instalment plan.

## the *supreme* precision camera in miniature.

The Zeiss Ikon Contax has been designed with one end in view—the production of the perfect miniature negative. This is attained by the wonderful definition given by the Zeiss lenses—the exactness of the focussing with the long base patent rotating wedge distance meter, and the fineness of the grain of the modern film, in which connection the Zeiss Ikon Pernox now supplied with both orthochromatic and panchromatic emulsions is an outstanding example.

**ZEISS IKON LTD., 11, Mortimer House, Mortimer Street, London, W.1**

# GET IT AT "THE WESTMINSTER"

## YOU CANNOT DO BETTER

### THE NEW MODEL IIIa LEICA

Shutter Speeds  
1 to 1/1,000th sec.

The Precision Camera.

F/2 Summar, automatic focussing, interchangeable lens mount, all chromium plated..... **£43:0:0**

Nine monthly payments of 100/6.

Model III, f/2 Summar, self-capping focal-plane shutter, speeds 1 to 1/500th sec., T. and B., chromium plated..... **£40:16:0**  
Nine monthly payments of 95/3.

### THE RAPID ROLLEIFLEX F/3.5

Zeiss Tessar Anastigmat, Compur shutter, speeds

1 to 1/500th second, T. and B.

Price unchanged

**£22:10:0**

Nine monthly payments of 52/6.

Absolutely automatic, takes 12 pictures 2 1/2 x 2 1/2 in. films.

### THE ENSIGN MIDGET

A Real Vest-Pocket Camera.

Taking 6 pictures 3 x 4 cm., costing only one penny each. All-distance lens, 3-speed shutter, 1/25th, 1/50th, 1/100th sec., T. and B.  
F/6.3 Ensign anastigmat..... **55/-**

The Multi-speed EXAKTA

Self-capping focal-plane shutter, speeds 12 to 1/1,000th sec., T. and B., delayed action 1/10th to 6 sec.

Fitted f/3.5 Zeiss Tessar anastigmat, metal focussing hood, with magnifier, simple focussing, 3 ft. to infinity Takes standard V.P. films. **£27:10:0**  
Double exposures an impossibility.  
Nine monthly payments of 64/2.

The "OMBRUX" EXPOSURE METER

For still cameras **84/-**

The "BLENDUX" For cine cameras **84/-**

Nine monthly payments of 11/1.

The LEICA is Now 1/1000 to 1.

## EXCEPTIONAL HOLIDAY BARGAINS!

# Close-up Pictures of Details with the Miniature Camera

This article shows how the miniature camera may be used with success for subjects which appear outside its range.

THE user of a miniature camera will probably often want to secure records of comparatively small details close to the camera, for which this type of apparatus is not well adapted. Apart from the small reflex, and the high-grade miniature equipped with a parallax compensation device, the photographer is in some doubt as to whether the subject is included upon the film, and also whether it is sharply defined.

Although it is admitted that the miniature camera is not well adapted for such subjects yet they may be attempted successfully, and without a great deal of calculation.

The first consideration is to decide whether the whole of the subject is included by the lens. In order to find this the following diagram is drawn. Upon a sheet of white card a vertical line is drawn equivalent to the focal length of the lens; for a 4 x 3 cm. camera this will be about 5 cm. At the base of this another line is drawn equal to the longer dimension of the film, in this case 4 cm. A triangle is then formed as shown by the dotted lines in the diagram. This indicates the angle of view included by the lens.

All that is necessary is to place this over the camera so that the vertical line first drawn is central with the lens and central with the negative. By

following an imaginary continuation of the dotted lines the angle included by the lens will at once be seen, and all included within the angle will be found on the negative.

Care must be taken to see that the camera is placed central with the subject. This can be seen by placing a pencil

against the lens, the pencil pointing straight towards the centre of the subject. The next consideration is the sharp definition of the negative, and this is a matter of careful measurement between the lens and the subject.

Most miniature cameras focus to a distance of three feet, and there is rarely need to be closer than this. When the subject is on a small scale it is safe to focus upon the nearest distance marked upon the scale, and to stop the lens down to the smallest stop. This will ensure sharp definition.

It is a good plan in such cases to be content with a small but sharp image which can be enlarged, rather than spoil the definition by bringing the camera too close to the subject. As enlarging is part of the procedure in any case this imposes no limitation, and ensures better general definition.

Finally, in the case of close-up subjects the exposure should be on the generous side, as they need more exposure than is the case when the subject is at a normal distance from the camera. These hints may be useful to those photographers who when on holiday equipped with a miniature camera wish to photograph a subject that seems rather beyond their scope. By proceeding as suggested they will be surprised at the successful results obtained.

## NEWSPAPER COMPETITIONS

By  
M. TAYLOR.

DURING the summer the great number of photographic competitions, most of them running for several weeks, gives the amateur a chance to get some of his money back. For photography can be an expensive hobby, and a little more money to spend on apparatus or materials is always welcome. The amateur who goes about it in the right way might even make a substantial profit on the year's working.

The first thing to do is to study the papers concerned. Some seem to prefer pictures of bathing belles, others usually choose children, while others again like a picture to be nicely composed and technically good before they will publish it.

Strong "human interest" is absolutely essential for newspaper competition work. The figures should be large in the picture space, and as a rule should have pleasing or humorous expressions. They must be clear and the background must not be confusing. Humorous "action snaps" with the action well up in the foreground, are almost certain winners.

Glossy bromide prints have most chance of being reproduced, and if you can get them glazed so much the better, though this is not really necessary. They should, however, be enlarged to a fair size, as then they are more likely to catch the selector's eye. Eight and a half by six and a half inches is reasonable, though I have had more success with pictures enlarged to ten by eight inches. Larger than this the packing gives more trouble, and, of course, the bromide paper is more expensive. Mounts add something to the attractiveness, but also to the cost, and if double-weight paper is used they can be dispensed with.

It is best not to send too many prints at once, but if the duration of the competition permits, to send them singly at regular intervals. Thus each print probably gets more consideration than it would if it were glanced at cursorily among several others.

In spite of the trouble it entails, competition work is good fun, and the excitement of seeing one's work in print is almost as welcome as the prize money.

Awarded First Prize in "News Chronicle" "At Play" Competition. By Mrs. M. Taylor.

# Kiddies and

*The Yacht.*

**N**OW that the summer holidays are here once again, our thoughts turn hopefully towards the boundless opportunities for picture-making offered by the sea, the sands and—last, but not least—the children.

The seashore is the kiddies' Paradise and the photographer's too, for where are kiddies to be found in jollier mood or a more delightful setting? Bathing, boating, shrimping, paddling, building castles or riding donkeys—these are but a few of the joys of the seaside. Just think of the thousands of pictures awaiting the camera at every turn.

On a crowded beach it is often very difficult to isolate one's subject from its surroundings, and many an otherwise delightful snapshot is spoilt by the muddle of deck chairs, arms and legs sticking out all round the main picture

*Anticipation.*

*Catch!*

in a hopeless jumble. The background is therefore all-important, and it is best, if possible, to coax the kiddies away to a less frequented corner of the beach. There is no better background than the sand or the sea itself, but do beware of that sloping horizon which is ruination to so many charming pictures. Viewpoint, too, makes a vast difference, especially in leap-frog and jumping pictures, when the use of a low viewpoint gives the appearance of the figures being much higher in the air than is really the case.

It must be remembered that the light at the seaside is extremely

# Cameras at the Seaside

By  
WINIFRED M.  
TURNER.

brilliant, and therefore over-exposure must be carefully guarded against. Many photographers on holiday prefer to develop their films after their return home, but it is a wise precaution to have one spool developed on the spot, in order to make certain that one is on the right track with regard to exposure.

The keynote for success in holiday photography is in

*Helping the sea to get full.*

enter into the fun of the thing and thoroughly enjoy helping to arrange the picture.

Children's bathing and paddling pools are never-failing sources of charming pictures, whilst the ice-cream cart often provides some humorous incidents.

*Lazybones.*

the ability to portray happiness in all its forms—and the kiddies will provide you with this. A smallish camera is best so that one may stalk the children un-awares, for the moment they become conscious of the camera much of the natural spontaneity of the picture is lost and a feeling of "stiffness" creeps in. Sometimes it is necessary to pose the children, and provided they are approached in the right spirit they will soon

*Bliss.*

*Heave ho!*

Above all, do try to get something a little different in your pictures—so many of the holiday pictures one sees have a certain "sameness" about them, and it is a refreshing change to come upon something a little out of the ordinary. Hundreds of awards in the various photographic competitions go to pictures of children—especially children on the seashore—and such awards are a material help towards holiday expenses. But even when the pictures are of personal rather than general interest they are none the less worth taking.

# NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

We have received a copy of "Amateur Photography in India," published by Thacker & Co., Ltd., Bombay. This is not only a good general guide to photography, but its application to India and tropical countries is particularly stressed. It should be of extreme interest to amateurs living or travelling in those parts of the world. The price is Rs. 2/8.

"Let's Halt Awhile," by Ashley R. Courtenay, is a delightful little book about places of interest in Kent, Surrey and Sussex. It has now reached a second edition, enlarged from 96 to 132 pages, and is published at one shilling by the author at 19, Adam Street, Adelphi, W.C.2. It should be in the possession of every motorist, cyclist, pedestrian and (above all) photographer.

Messrs. Pathéscope, Ltd., North Circular Road, Cricklewood, N.W.2, announce that they now have available for "home movies" some 9.5-mm. "Mickey Mouse" films. They are also now supplying reloads of their Rapid Ortho Fine Grain films in cartons. Full details of these and other productions are set out in the August-September issue of the "Pathéscope Monthly," price twopence, from the address above.

A competition for snapshots of dogs is being run by the proprietors of "The Dog World," which can be obtained for 3d. from any newsagent. There are no entry fees, and three prizes are offered for the best prints submitted.

The Photographic Miniature Postal Portfolio is about to enter on a new year of its successful career. No fewer than five circles are already in operation, and there is every likelihood of the number increasing. Particulars as to membership, etc., may be obtained from the general secretary, Mr. Geo. A. Slight, 18, Ewelme Road, Forest Hill, London, S.E.23.

Every photographer finds the need for a reliable medium for spotting negatives and other purposes, and an excellent one is now prepared by Messrs. Johnson & Sons, Hendon, under the name of "Liquid Opaque." It fulfils its several uses admirably. Pinholes in negatives can be filled with a touch of a fine pen or brush; parts of the negative can be blocked out entirely; title slides can be made by writing, or by applying a solid coat and scratching the letters with a sharp point. Even clouds can be introduced by applying the medium in various degrees of dilution to the

"wrong" side of the negative. It is obtainable through dealers in 1 oz., 6 oz., or 12 oz. bottles.

Last year we reviewed the "Vauxhall de Luxe" Camera, for 16-on-8 roll film  $3\frac{1}{4} \times 2\frac{1}{4}$ , marketed by The Camera Co., 320, Vauxhall Bridge Road, Victoria, S.W.1. We have now examined a new model of this well-made and handy instrument. The body is now

made of a new unbreakable bakelite, with the appearance of fine-grained black leather.

The two windows at the back have an ingenious internal cover to facilitate the use of panchromatic film. An f/2.9 Meyer anastigmat in D.A. Compur shutter is still fitted, and the price remains the same as before, £6 15s. An excellent velvet-lined leather case is 7s. 6d. extra. At the low price asked the camera is well worth the attention of miniature workers.

## THE WEEK'S MEETINGS

### Wednesday, August 14th.

Leigh Lit. Society P.S. Winwick.

### Thursday, August 15th.

Hammersmith H.H.P.S. A Symposium on Negative Development.

## Exhibitions and Competitions CURRENT AND FUTURE.

Notices of forthcoming exhibitions and competitions will be included here every week if particulars are sent by the responsible organisers.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate, and Advanced Workers. Entries, August 31. Rules in the issue of July 31.

California Pacific International Exhibition, San Diego.—May 29–November 11. Particulars from Miss Ruth Kilbourne, Exhibition Headquarters, Balboa Park, San Diego, Cal., U.S.A.

Paris International Salon.—October 5–20. Secretary, M. E. Cousin, 51, Rue de Clichy, Paris.

Southern Counties Salon (organised by Camberwell C.C.).—August 11–31. Hon. Salon Secretary, W. Bertram, 45, St. Lawrence Road, Brixton, S.W.

South African Salon (Johannesburg).—August 20–31. Hon. Secretary, Johannesburg Photographic Society, P.O. Box 7024, Johannesburg, South Africa.

Amsterdam International Salon.—September 14–29. Further particulars from Focus, Ltd., Fotosalon, Bloemendaal, Holland.

London Salon of Photography.—Entries, September 4; open, September 14–October 12. Further particulars from Secretary, London Salon, 5a, Pall Mall East, S.W.1.

R.P.S. Annual Exhibition.—Entries, August 16; open, September 14–October 12. Further particulars from Secretary, 35, Russell Square, W.C.1.

Irish Salon (to be held at Mansion House, Dublin).—Entries, September 14; open, November 2–9. Particulars from Hon. Secretary, Irish Salon of Photography, 18, Morehampton Road, Dublin.

Rotherham P.S. International Exhibition.—Entry forms due, September 23; prints, September 30; open, October 16–19. Hon. Exhibition Secretary, E. George Alderman, Ruardean, Newton Street, Rotherham, Yorks.

Indian International Salon (promoted by Camera Pictorialists of Bombay).—Entries, October 1; open, November 17–30. Hon. Salon Secretary, F. R. Ratnagar, Central Bank Building, Fort, Bombay, India.

G.W. Rly. "Camp Coach" Holiday Competition.—Prize, one week's holiday in camp coach during 1936 holiday season. Photographs should depict any aspect of camp coach holiday. Entries due,

October 31. Further particulars from Superintendent of the Line, G.W.R., Paddington Station, W.2.

Canadian International Salon, National Gallery of Canada, Ottawa.—November 6–21, and afterwards in other Canadian cities. Entries due, September 20. Entry forms and further particulars from Exhibition Secretary, Canadian International Salon, National Gallery of Canada, Ottawa, Canada.

Cape of Good Hope International Salon (under the auspices of Cape Town P.S.).—Entries due, November 19; open, January, 1936. Hon. Salon Secretary, Richard Dekenah, P.O. Box 2431, Cape Town, South Africa.

Leicester P.S. International Exhibition.—Entries, January 24, 1936; open, February 24–March 7, 1936. Exhibition Secretary, H. Foscutt, 19, Doncaster Road, Leicester.

The 40th Annual Exhibition of the South London P.S.—Open, February 15–March 14, 1936. Entries close, January 21. Further details and entry forms from Hon. Exhibition Secretary, H. S. Adams, 140, Stockwell Park Road, London, S.W.9.

## The New "Large Miniature" of the Future

### SUPER IKONTA

530/16.

If you own the new Model No. 530/16 Super Ikonta for  $2\frac{1}{4} \times 2\frac{1}{4}$  pictures you can truly say that you possess the most up-to-date camera obtainable. The "Large Miniature" camera of the future. This instrument, constructed by the world-famous Zeiss Ikon craftsmen, is now available and we can supply by return. One of the many features of this ideal camera is the distance meter—made on the new Zeiss Ikon rotating wedge principle—coupled with the lens focussing and built in the die-cast body. The photographer of to-day does not guess distance—he turns the milled wheel of the distance meter and the Super Ikonta does the rest. The shutter, too, is coupled with the film-winding mechanism, thus making unintentional double exposures as impossible as badly focussed negatives.

The Super Ikonta No. 530/16, measuring only  $2\frac{1}{4} \times 3\frac{1}{4} \times 5\frac{1}{4}$  in., takes eleven pictures  $2\frac{1}{4} \times 2\frac{1}{4}$  on the usual  $3\frac{1}{4} \times 2\frac{1}{4}$  roll films. Thanks to the accuracy of the distance meter in focussing, the Super Ikonta is fitted with the most rapid Zeiss Tessars f/2.8 and f/3.5, the new Compur Rapid shutter, giving exposures from 1 to 1/400th sec., and time exposures (delayed-action "take yourself" release feature also), will tackle the fastest-moving objects, sports of all kinds, horses jumping, and pictorial pictures, perfectly composed and accurately focussed. Thus the Super Ikonta is a really universal camera.

Die-cast body of aluminium, exceptionally strong, with range-finder built in, all in one piece. Hinged back, front self-erecting; a press of a button and the front automatically springs up ready for taking the picture. Direct built-in type view-finder showing exact field of view, unique spool-holders of quick-loading design. Release lever situated conveniently on top of camera body. Interlocking arrangement prevents double exposures. Takes any make of film, obtainable anywhere.

#### PRICES:

Fitted with ZEISS TESSAR lenses and COMPUR O.S. Rapid shutter, 1 to 1/400th sec.

530/16L, Zeiss Tessar f/3.5 lens

**£25 : 5 : 0**

530/16P, Zeiss Tessar f/2.8 lens

**£28 : 5 : 0**

Let us send you a Super Ikonta No. 530/16 and test for yourself the new distance meter. You will appreciate the elegant yet practical appearance and fine finish of this typical Zeiss Ikon instrument.

**WANTED.**—Cameras in exchange for latest new models. Definite allowances. All makes supplied immediately. Hire Purchase.

#### GUARANTEE:

Every Latest New Camera (any make) supplied by ourselves is sent with our free Six Months' Personal Guarantee. By filling in the printed guarantee form supplied with every new camera, you are automatically covered against any possible defect or fault whatsoever.

● Get your New Camera from us and be sure of perfection. ●  
Write to-day.

## EDWIN GORSE

86, ACCRINGTON ROAD, BLACKBURN

## DOUBLE EXPOSURES IMPOSSIBLE

WITH A

# Leica

THE WONDER CAMERA

Shutter Wind and Film Advance automatically coupled, giving rapid succession Snapshots without danger of double exposure.

ONE of the most pleasing features of the Leica, and one which avoids many disappointments, is the automatic elimination of double exposures.

The shutter wind and film advance are automatically coupled. After making an exposure, the shutter release will not work a second time, and only when fresh film has been wound into position does the release again become operative.

The Leica is so simply operated that inside ten minutes you can be taking pictures of any subject you fancy (from the study of flowers or insects with close-ups to motor racing at Brooklands). The Leica is quite indifferent to the light—it will even take snapshots at night—in fact, the full possibilities of Leica can only be explained in the many booklets published—let us send you them!

### WE STOCK EVERY LEICA MODEL, AND OFFER THE FINEST LEICA SERVICE IN GREAT BRITAIN.

LEICA MODEL III, with f/2 Summar lens, £39 10 0  
Nine monthly payments of 92/2.

LEICA MODEL III, with f/3.5 Elmar lens, £30 10 0  
Nine monthly payments of 71/2.

12 PICTURES, THIS SIZE, FOR 1P EACH

with the

# Rolleicord

Here is the ideal twin-lens roll-film mirror reflex for your holidays. In spite of its small, compact and handy size, it gives large prints—large enough to appreciate fully without the necessity of making enlargements. The focussing screen eliminates useless snapping. It shows you the picture (the right way up) you wish to take—as large as the finished print—therefore you can reject all subjects which do not appeal to you *before* you have actually taken them—you can't do this with ordinary cameras. Only one lever is used for setting and releasing the Compur shutter, which is speeded up to 1/300th, also time and bulb. Takes 12 pictures on  $3\frac{1}{2} \times 2\frac{1}{4}$  8-exp. roll film for 1p. If you want to bring home beautiful holiday pictures, choose the Rolleicord—the *easiest* of all cameras to use. With leather-covered body and Zeiss Triotar f/3.8 lens. May be adapted for plates as well as roll films **£12 : 15 : 0**

Also obtainable with metal body and F/4.5 Zeiss Triotar, £10 10s. For Roll Films only.

# How I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCXCIV.

Mr. ERIC  
J. HOSKING.

From information communicated to our Special Representative.

"ALTHOUGH my early efforts in photography are of great interest to myself from the point of view of progress, I hardly feel them to be worth recording as a source of inspiration to readers of this article. Let it suffice to say, then, that I was influenced to a very large extent, when young, by the books and lectures of the Kearton Brothers, whose autographed works are among my most prized possessions. It followed that I, too, with a love of wild life, and an enthusiasm for the camera, should combine these two interests, and eventually specialise in photographing British wild natural history—birds, animals and plants in their natural surroundings. I should add that it was not until I joined the North Middlesex Photographic Society, and later the Zoological Photographic Club, that I made real headway with my exhibition prints.

"In addition to the joy of working among the delights of Nature, I also obtain great satisfaction from the thought that in this branch of photography the camera is doing excellent work, and is making possible many discoveries without which the naturalist would still be so much in the dark. No longer is he obliged to shoot and stuff an animal before recording an impression of it, and such inaccuracies as the picture of a seed-eating bird complacently holding insectivorous food in its beak are atrocities of the past.

"The ever-changing face of Nature provides me with ample work all the year round, but work on bird studies similar to 'Kestrel brings rat, as food, to its young,' is commenced at the beginning of May, when I journey forth to one of the many estates upon which I am so kindly granted permission to work.

"For natural history photography

I find a variety of 'plant' necessary. When photographing from the 'hide,' I prefer a  $\frac{1}{2}$ -plate Sanderson field camera, fitted with an  $8\frac{1}{2}$ -in. f/4.5 Dallmeyer Serrac lens, using the lowest aperture possible, and employing a Luc shutter as being the most effective for this type of work.

"For birds in flight, and other moving subjects, I find that a  $\frac{1}{2}$ -plate Soho reflex camera fitted with either a 12-in. or 17-in. Dallon Telephoto lens suits my purpose; and for still-life I use a Zeiss Ikon  $3\frac{1}{2} \times 2\frac{1}{2}$  folding plate camera fitted with a  $4\frac{1}{2}$ -in. f/4.5 Tessar lens. For most subjects I use either Ilford Soft-Gradiation or Hypersensitive Panchromatic plates (backed). I always make a point, however, of carrying with me a supply of hypersensitive film packs.

"The account of how I erect my hides and cunningly deceive the bird into thinking that I and my retreat are part of the landscape needs an article to itself. We must therefore suppose that I have made a number of exposures and am back in the dark-room to face further technicalities.

"I make no set rule about which developer I use, this depending upon details of exposure, etc., but I generally develop by tank. I always aim to produce a negative which, when directly enlarged, presents a finished picture, as it is an unwritten law that retouching is forbidden on this class of work, except, of course, the obvious necessities of subduing high-lights and reducing heavy shadows.

"To make the print, I enlarge to  $15 \times 12$  on chloro-bromide paper by using a horizontal enlarger. After drying, I scrutinize the work by daylight, as a chloro-bromide print presents a very different appearance, under these conditions, from its aspect when wet and viewed by artificial light.

"The final thrill of gazing upon the finished exhibition print in all its glory, is rivalled only by the intensely exciting moment at the birth of the picture, when the bird is poised and with swift movement I obtain its secret, and bear it away into the human world."

(A further example of Mr. Hosking's work is reproduced on one of the centre Art pages.)

GARDEN WARBLER.

Eric J. Hosking.

# Pictorial Analysis

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"THE CALL OF THE SEA," by P. N. Johnson.

THE subject of our discussion, this week, has points of resemblance with that reviewed in our last issue, inasmuch as both are of the holiday type, both deal with figures at the edge of the sea, and both exhibit a desirable simplicity of arrangement.

Here, however, the interest centres in a single figure in place of the two in the former instance, the sea is in a more turbulent mood, and sunshine, with its vitalising influence, is more fully in evidence and quite distinct from the diffused lighting of the other. With the single figure (1), and having regard to the fact that she is coming directly towards the camera, the more central placing is justified, though, it will be noticed, the actual centre has been carefully avoided.

On this account, symmetry, with its concomitant suggestion of formality, is prevented from making an appearance. The adoption of the present placing was wise, for, if the figure were put in the exact centre, the feeling would be static and not by any means in harmony either with the sense of movement or arising from the tumbled nature of the water or with the pose in which the figure is shown. Now, the factors of pose, placing, and the conveyance of a sense of motion are all in accord and play a mutually interdependent part. The pose, if not altogether graceful, is natural and gives an idea of being influenced by the swirl and rush of the incoming tide, while the inclination of the arms, as well as the angle at which the legs are shown, help the suggestion of movement by reason of their slanting direction.

In this connection, it may be mentioned that lines or directional impulses on the slant tend to convey an impression of movement, both upright and horizontal lines suggesting a more static feeling. Verticals might be said to create a sense of dignity and height, and horizontals peace and restfulness.

In this instance, the arms are inclined, the trunk of the body is off the vertical, and the legs are on the slant but in an opposing direction. In the immediate foreground, the lines of the surf are also inclined, and, just about the level of the figure, there is a directional tendency from both margins downwards towards the figure, but, in the upper reaches of the picture, the waves are more or less horizontal.

little, as, to some extent, it introduces a note of competition which attracts some of the attention which should be devoted to the figure.

It is true that the lights on the figure are more intense, and that they are very greatly enhanced in value by the presence of the near-by darks, but the suggestion of competition, even if it does not seriously impair the principality of the figure, does exist,

and needs to be removed by any treatment that may be considered appropriate.

Apart from this small point, the arrangement, in general, seems satisfactory, and, it will be noticed, has the advantage of a high viewpoint, which, besides avoiding another possible source of competition in the sky, also lends a touch of novelty to the presentment.

The fact that the outlook is seaward, too, avoids the inclusion of many of the disfigurements with which our holiday resorts are plentifully endowed, and, possibly for the same reason, intrusive and unwanted figures are also excluded.

Choice of viewpoint and the selection of the right moment for making the exposure are also contributing factors, and, in this class of work, the picture attains quite a high standard. The way the feeling of sunlight is conveyed is very well done and decidedly out of the com-

mon, and the impression of joy of life and care-free vivacity are nicely suggested by the model's expression.

Altogether, it is a seasonable piece of work, and, after the holidays are over, one that, by the memories it stimulates, will recapture some, at least, of the spirit of the time.

It is, perhaps, hardly necessary to point out that in many cases a necessarily hurried exposure on such subjects as this does not come up to all the desired requirements in the finished result. That is why it is desirable, if the circumstances permit, to make more than one exposure.

"MENTOR."

The effect of the slanting lines is readily seen, but, in order to prevent the suggestion of motion from becoming too assertive, the horizontal lines at the top are retained, and admirably serve this purpose. The lines in question may, possibly, be more easily traced in the accompanying sketch than in the original, but it would scarcely do for them to be too obvious, for, if they were, they would attract so much attention that they would be unable to fulfil their function. As it is, they do well enough, but it might be as well to arrange for the tone of the splash of foam on the left-hand edge to be toned down a

# PICTURES by Novices

SOME CRITICAL COMMENTS on  
the Beginners' prints reproduced on the opposite page

THERE is an abundance of subjects, and of a high pictorial value, to be found in the neighbourhood of harbours and fishing villages. A lot of it has gone, of course, with the introduction of auxiliary power and the consequent diminution of sail, but, nevertheless, there is still plenty to be done, as some of the examples reproduced this week very well show. Probably more diligent search is now necessary.

## Sails and the Sea.

In only the remotest places, nowadays, is it possible to find the almost "set" pieces—vessels with their sails and nets disposed to dry—at all prevalent, but that steamboats are not devoid of attraction is demonstrated in No. 2, "Dutch Fishermen," by E. Harrison.

This shows the sterns of two vessels with a group on each as the centre of interest, and these are well displayed against a bright and atmospheric setting. The group in the centre, having regard to the greater prominence of the figures, is the more significant of the two, the nearer set forming a subsidiary interest. The water is diversified by a hint of reflections, and, taking it all round, the subject has been very well handled, and is sufficiently interesting.

The strip of sky at the top, if not unduly assertive, scarcely advances the interest, and its removal would tend to enhance the attraction below, but, otherwise, the only criticism that could be made is in connection with the way the figures are displayed.

It is understood, of course, that in this instance it is unlikely that any better arrangement could be found, for, while looking for it, the probability is that the existing grouping would be lost, but, if the contrast between the figures and their setting could be heightened, they would be better isolated and play their part in the scheme more effectively.

## Subject and Setting.

Dark against light or light against dark attract the attention better than when the distinctions are less. The isolation is decisive, and it is wise, whenever possible, to endeavour to show figures, in circumstances such

as these, so that they make the maximum contrast with their surroundings.

No. 3, "In the Suez Canal," by W. M. Lee, does, as it happens, include a boat in full sail. The boat itself is nicely caught, but the bank of the Canal, with its strong tone, seems somewhat out of tone with the rest. It is too forceful for the remainder of the composition, but, on the other hand, it is difficult to see how matters could be amended.

The subject seems to have been taken from another vessel, and it would be impossible to make any effective change in the viewpoint without risking the entire loss of the picture. It is more satisfactory, as a rule, to work from a quay wall, for then there is some choice of standpoint available, and, if the lighting is not all that could be wished at one time, another visit may offer better conditions.

## Reflections an Aid.

The group of boats in No. 4, "In Harbour," by John Stirling, would, for example, provide quite a lot of room for experiment. The existing arrangement has points of appeal, but under more powerful sunshine, or with an absence of wind, a no less attractive picture could be made up.

The relationship of the boats with one another could be considerably varied, and, if the reflections were not quite so obscured by the ripples, they would add a further embellishment.

It may be mentioned, however, that, when the sun is high and full on the water, the reflections do not stand out so well as when the water is in shade or when it does not receive the light from so high a source. In No. 5, "Shrimpers," by C. W. Cousland, where the water is still, the reflections are not so vivid as they might be for this reason, and later on, when the sun had gone off the water, they would be much more marked. This is a point to be kept in mind.

Here, sails do make an appearance, but they do not happen to show up very well—as compared with those in No. 3—and it is usually after a shower that they are so arranged that they show to the best advantage. At such a time, particularly if the sunshine is brilliant, the opportunities

for picture-making are prolific, and the point is one that should be kept in mind in case the eventuality arises.

## Pictorial Possibilities.

In the vicinity of the sea, however, there are other possibilities for picture-making apart from harbour scenes and studies of vessels with or without sails.

A rough sea, properly handled, can make a most attractive theme, and a hint of such possibilities is to be seen in No. 1, "High Tide," by H. Bailes.

The waves are, here, by no means as big as they can be, but, all the same, some idea of what can be done in this direction may be gathered. The splash of foam, which forms the centre of interest, is placed rather too much over to the left, and a little more space on that side would be an advantage, but the moment for making the exposure has been very well judged, and the swirl of the waters is nicely rendered.

"The Seventh" (No. 6), by J. A. Holcroft, does not tell quite so well, partly because the foam is shown against the sky, which is almost as bright, and partly because it is, comparatively, a good deal farther off.

## Contrasts of Extremes.

The value of the rule concerning the placing of extremes in contrast applies as much to subjects of this nature as to figure studies, and, had it been found possible to show the wave against a dark—as was done in No. 1—it would stand out much more effectively than at present.

Even in No. 7, "Sunset on the Hooghly," by E. Garner, which suffers to a not inconsiderable extent from its hackneyed nature, the value of the principle is evident, for the brilliance of the sun against its dark setting exerts a pull which is undeniably powerful. All the interest centres in that point, and it is simply this that makes the composition seem so strong in this case.

In comparison, No. 8, "Llyn Llydaw," by A. Cole-Hamilton, seems to lack cohesion, and, though the nature of the foreground is partly responsible, a like juxtaposition of extremes of tone would be useful in pulling it together.

"MENTOR."

# With the Beginners

## NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

### A SIMPLE CAMERA BY THE SEA.

LAST week I proved (I hope) that even with the difficult conditions at the Zoo it is possible to get photographs even with a camera so simple that it is limited to  $f/8$  for the stop and  $1/25$ th of a second as the only shutter speed. I pointed out, however, that if it is of the fixed-focus type this will certainly rule out certain close-up subjects. I hope to revert to this work soon.

If there is one locality where the simplest camera can shine it is on or by the sea. Here, as elsewhere, it has its drawbacks, but they are fewer than in most other surroundings. If no quicker exposure than  $1/25$ th of a second can be given this will hardly be fast enough for some subjects; but even cheap cameras to-day are fitted with shutters with three marked speeds, the favourite numbers being  $1/25$ th,  $1/50$ th and  $1/100$ th. In most cases they are merely nominal, and the  $1/100$ th is more likely to be about

$1/40$ th. At any rate, it is faster than the slowest, and may often be used with advantage.

Many cheap cameras also have a choice of stops, and their  $f$ /numbers should be found, if not already known. An exposure table or a meter will show how much exposure may (indeed, must) be cut down for open seaside subjects, and over-exposure is a real danger that must be guarded against.

The other day I made a dash for the nearest seaside place—Southend; and those who know it will admit that it is hardly an ideal place for picture-making. But I was not out for pictures, but for some simple illus-

Fig. 1.

trations on which to base a few hints.

For example, Fig. 1 is to show what is not the best view of a sailing vessel—broadside on; the same subject as in Fig. 3 is generally better. The barge in Fig. 2 is broadside on, but it is merely incidental to the sea and sky effect. (This is an old print, not from Southend.)

Fig. 2.

Fig. 3.

Fig. 4.

At Leigh, which adjoins Southend, the fishing fleet has adopted motor engines, but sails are still in evidence on these waters. A point to bear in mind is that distances on the water are deceptive. A yacht like that in Fig. 3 may be quite tiny in the negative, as this is, although knowing its size we think it will be larger. The lens knows better, and the finder will give us a pretty plain hint if we take note of it.

Steamers approaching or leaving a pier or landing-stage are easy game, if only a clear view can be obtained, free from intruding heads and waving

handkerchiefs. Fig. 4 was taken against the sun, which was somewhat obscured or there would have been trouble in the form of fog. I had left my lens hood at home, which was particularly foolish in view of this kind of work.

I saw one photographer, later on, pointing the lens bang at the blazing sun, and struggling in vain to locate some kiddies by peering into a tiny finder which must have looked like a

miniature fiery furnace. This operator was a lady in a bathing dress, and as she is not likely to be an "A.P." reader I venture to remark that she was about the worst handler of a camera I have ever seen.

I saw other ladies (more or less clothed) snapping each other with, I am sure, the most horrible results; but I saw no one photograph the subject in Fig. 5. I have seen a fine painting of this with the tide in, and a sunset behind it, but it is worth recording even with a camera. It is the Crow Stone, and marks the boundary of the jurisdiction of London

Fig. 5.

in the Thames; London Stone at Staines is the corresponding up-river mark.  
W. L. F. W.

## Variety in Holidays

By  
W. W. MORRELL.

A BUSY man at the end of a winter day often finds his best tonic in a quiet hour with his albums of photographs, which recall the brightness of summer and of days free from care. A renewed acquaintance with places, people and experiences of happy association lifts a man out of himself when he feels that things as they are have almost passed endurance. In making plans for a holiday, therefore, it is suggested that the amateur photographer should pay attention not merely to his whims and notions of July or August but to the needs of many a succeeding December. How then may one's photography be made the most potent of winter tonics for a tired man? I hope I have some sort of an answer to this important question.

There are those who find great joy in an annual return to some favourite spot. Its well-known scenes are soothing and the renewal of former friendships is highly valued. There are no worries in making arrangements, as one knows all about everything. But is not that a drawback to him who would prepare his winter's tonic during an all-too-short vacation? Neighbouring beauty-spots are all snapped in one or two holidays, and in a very few years the album will lead us in only one channel of thought.

Of recent years the touring holiday has gained merited popularity. On railways, highways and waterways, people are travelling great distances, seeing new scenes, studying new customs, and enjoying a multitude of delightful experiences. Thus the album is abundantly enriched, but one sometimes hears little regrets—"We would have liked to see So-and-so, but we had not long enough time ashore"; "We were going right to Such-and-such, but we lost a whole day with ignition trouble and had to cut it out." Thus the picture that might mean so much to the collection is never taken and the album is the poorer.

For some people there is a better holiday plan than any of these, and certainly it must invariably be fruitful in results for the amateur photographer. Some would say that it is a slow way of making a collection, and I confess that with myself the plan is only in its infancy after a dozen years; but great results are generally the outcome of slow processes.

Mentally, I have divided the world which I can hope to see into groups of places-that-must-be-visited, and to one of these I go each year, in no fixed order, but as opportunity and circumstance permit. I steadfastly refuse to allow any particular delights to lure me back to the same place a second time if I have done it reasonable justice with my camera on the first visit, believing that in this sense "the best is yet to be," and realising that life is short and the world is large.

Settling in one place for the several weeks of my holiday, I see everything there is to see within a radius of, say, a hundred miles, and return home with a load of spools giving me an exhaustive pictorial record of one more of the places-that-must-be-seen. So now, at my own fireside, I see again scenes that had to be sought out at hours and in lights for which I had to plan carefully—French fishing-boats returning home in the early morning; a beautiful horse at a Manx show; a Perthshire hill which Shakespeare knew; shy deer in a London park; a little white church near Aberdeen where the Scottish crown and sceptre were hidden in troublous times; a narrow street in Central Europe at the only hour when an amateur's humble apparatus could take it; a gala day at a Lancashire resort; a field of hay on a rocky headland far from any road; a Scottish kirk of which only a glimpse can be seen from any angle; a Swiss dungeon where a martyred patriot languished; a lonely donkey in a Cornish lane; the fishing-fleet in a Caithness harbour; and many another hidden beauty revealed only to the leisurely sojourner.

# Picture Points

## for Beginners by RICARDO

### Cutting out Unnecessary Surrounds

**M**OST beginners are loath to trim anything off their prints, particularly with contact prints. It may be due to the fact that the print will look skimpy after liberal trimming, and so reduce it down to a picture that could have been taken by a miniature camera. Others will argue that the lens was, say, an anastigmat, and therefore everything that the lens included in the picture was perfectly correct for perspective and quite free from distortion. This is partly true, but, as far as the print is concerned, it does not reckon with the æsthetic view.

Most beginners' cameras are fitted with lenses whose focal length is approximately the same

as the diagonal of the negative. This gives a "field of view" that is much wider than can be seen by the eye in any one position, and consequently looks "unnatural." This is most noticeable when we have subjects that lead away into the distance straight in front of the lens. This is called foreshortening. It must not be thought that this extreme foreshortening is a defect in any particular lens, as all lenses will show this same characteristic.

Most photographers are aware that a lens in a rising front will eliminate the intrusive foreground, like that shown in the two sketches, but they do not realise that extreme foreshortening is not concerned with the ground only, but applies to all planes, whether they are walls or ceilings, or whether the camera is pointing up a lift-shaft or down the stairs.

As we are concerned only with the pictorial side of the picture, it is better to take off some of the superfluous surrounding "field" when we have subjects like those illustrated. The dotted lines show the suggested trims. This helps us to concentrate the attention on the real subject matter without having unnaturally large foreground items in competition all the time.

other remedies which are far better. The first, is trimming out the white patches wherever they occur, or, should that spoil the composition, we have the alternative of toning down the lighter patches by hand-work until they are suitably darker.

In the second sketch of the barrels, where the tops and corners have been left light, the same effect occurs. To trim them all away would immediately cramp the remainder, and in such a case we should have to resort to retouching, preferably on the print. This can be done in a variety of ways, but the beginner is advised to use a pencil first until sufficient experience is gained in matching tones, and then, later on, use a fine brush and water-colour tints.

### Light Tones on the Edge of the Print

**T**HIS point is concerned chiefly with prints that are mounted on light mounts, particularly prints with dark heavy tones. If we had a picture like the sketch on the left and put it on a white or cream-tinted mount it would look as though it had been trimmed with scissors round the contour of the trees, and not with a straight-edge, as is usually done. The borders have been purposely left out in order to make this point clear and to show the effect.

We may, of course, mount it on a dark mount, which would then contrast the white patches and so reveal the straight edge. But this kind of treatment is to be deplored. There are two

### Monotonous, Unbroken Tones

**I**N an early issue of this series of "Picture Points" we discussed the fault of irritating, spotty backgrounds, and advised the use of plain, simple tones instead. There are exceptions to this rule, however, and an example is shown here in the still-life sketches. In the first sketch, although the orange is shown in a strong position on one of the "thirds," with good tone contrast, placed on a sufficiently strong base, against a background left perfectly plain, we are soon conscious of the overpowering effect of this plainness. The tone is unbroken throughout, and it is this that causes it to be monotonous. This can occur to all tones, whether light, medium or dark, and the larger the area, the worse it appears. We can, of course, trim it all away, but that is only an afterthought to bad arrangement. If we realise that in such a subject the background is to play a silent but effective part in the whole scheme, there are many ways by which we can relieve the monotonous, unbroken tones. This offers a wide scope to the enthusiast, bearing in mind that shades of grey are safer than colours, and that "simplicity of variety" should be the keynote.

# Not so Easy *to get* "Everything" Sharp

By ROY STONE.

THE indefatigable "W. L. F. W." in one of the most helpful Beginners' articles he has ever penned ("The A.P.," July 17th, 1935, page 64), dealt with hyperfocal distances and depth of definition. He worked out for the oft-puzzled amateur the distances to be observed by users of hand cameras with lenses of 3-in. and 6-in. focus, and said that when using a 6-in. lens it is "not so easy to get 'everything' sharp."

In other words, it is much easier to get "everything" sharp when using a 3-in. lens than when using one of 6-in. focus, a fact users of miniature cameras will appreciate. There is no need to reprint the figures given so recently in these pages, as most readers will be able to refer back to them.

Not having a leaning towards arithmetical calculations, the figures (distances) given by our teacher were of particular interest and usefulness to me, as I am in the habit of using a reflex hand camera fitted with an  $f/4.5$  lens of 6-in. focus, and am well aware of the difficulty of getting "everything sharp" when I wish to do so, particularly when using the camera in the hand and giving snapshot exposures. Detail is most important in the pictures I make, as I am keen on lantern-slide work.

A few days ago I photographed a 200-year-old cottage in which a once-famous witch is said to have lived, and the best I could do with the reflex and its 6-in. lens (used at  $f/6$ ) is shown here in Fig. 1.

The result, I believe, is technically good, but the broad expanse of uninteresting road as a foreground is not pleasing, and something is wanted in the bottom left-hand corner to balance the composition. The shadow of a tree on the bare road (which I took pains to include in the picture) is not strong enough to help the composition, but it is perhaps better than nothing.

Fig. 1.

Fig. 2.

A bramble and wayside flowers grew on the opposite side of the road, but they could not be included in the picture, because they were too near to the camera, and for a snapshot exposure, the depth of focus (with the  $f/6$  necessary for an exposure in the hand) did not allow foreground and distance to be in focus at one and the same time.

Thanks to W. L. F. W.'s calculations I was able to secure the picture shown in Fig. 2, which I consider to be a more artistic rendering. The calculations told me that if I focussed my 6-in. lens at 20 ft. and used  $f/16$  in the lens, objects from 9 ft. 8 in. to infinity would be in focus, and this proved to be the case. The focussing screen permitted me to check this before exposing; it is at the same time a useful fact for users of focussing-by-scale cameras to be aware of. Indeed, all the information and figures given on page 65 are of great value to all users of any kind of camera.

Using  $f/16$  a snapshot exposure was not considered advisable, as the exposure required with this stop is seven times longer than that necessary for  $f/6$ . By placing the camera on a tripod it was possible to give the necessary brief time exposure called for by the smaller stop.

It was also deemed advisable to make a vertical rather than a horizontal composition, mainly to make greater use of the foreground foliage, for as Ruskin once said, "The foreground is the doorstep to a picture."

# Letters to the Editor

*The Editor is not responsible for the opinions of his correspondents.*

## CAMERA MOVEMENT DURING EXPOSURE.

SIR,—It is true that my article did make the assumption that camera movement pivots round the lens, but if the movement is truly lateral (lens and plate together) it upsets the conclusions very little, as Mr. Buckmaster will notice if he sets out this movement on squared paper, on the line of my diagrams.

But Mr. Buckmaster will have to bring up heavier guns than mere sarcasm, if he wishes to dispute the point that the smaller the camera the more important camera-shake becomes. It is recognised by all writers on miniature cameras and is the painful experience of most new-comers to this work.

Mr. Messham shows that a rotation of the camera through an equal angle will produce an equal amount of focal "blur" for all lengths of lens. I agree to this at once, but I maintain my point. No one can hold a camera quite still. Assuming a swing of the body of even a fraction of an inch per second, then a fiftieth second exposure will produce a definite camera movement for any camera, and the angle of swing will be greater for the short-focus lens. I am convinced that this is the true explanation of the disappointments many people experience with ciné-film cameras.—Yours, etc., R. E. DICKINSON.

SIR,—Mr. Dickinson's article on camera-shake was very interesting, but I should like to cross swords with him, since I have not found miniature camera shake such a terror as he implies it is, and rather disagree with his theoretical reasoning.

Mr. Dickinson's diagrams are rather misleading, as they show *either* two cameras acting on objects at different distances, or on very near objects, in which case the plate-lens distances are not the focal lengths. Also I cannot grasp the significance of the term "length of subject blurred," for the eye assesses the value of the image on the plate, not the subject. This "length of subject blurred" obviously increases as the object distance becomes greater, whereas the blurred image of a distant object is generally less obtrusive than that of a nearer subject, to my mind. Thus the treatment should deal with the effect on the image when the camera is moved.

It would be interesting to know what the result of practical work, taking a camera and moving it, would show.—Yours, etc., M. L. HASELGROVE.

SIR,—Mr. Dickinson's article on the subject of camera-shake is entirely admirable, as far as it goes. I feel, however, that, in practice, bodily translation of the camera as a whole occurs much more frequently than rotation of the camera about the lens as centre, to which your contributor confines himself.

Analysis of the case in which the camera is moved bodily seems to show that with the same amount of movement, and ignoring as a separate issue the question of granularity, enlargements to the same size from a miniature camera and from one giving a larger negative would have the same degree of definition for objects in focus.—Yours, etc., D. HENNESSEY.

## DEVELOPING ROLL-FILM NEGATIVES SEPARATELY.

SIR,—I think the great difficulty in developing roll-film negatives is that the whole spool must be developed together. This results in uneven developing of every single negative so that one is over-developed and the other under-developed.

My opinion is that some notching or pinhole made by a pin on the margin of every negative when setting the shutter, and withdrawn when releasing, would be a great help for every possessor of a roll-film camera, because it would enable one to cut the film in as many pieces as exposures and enable them to be developed separately. Possibly some camera manufacturer will consider this suggestion.—Yours, etc., N. GURWICZ.

(Warsaw.)

## FILM OF LONDON.

SIR,—With regard to the article in your issue dated July 17th, called "Making a Film of London," your contributor says "It is possible to shoot off many reels of film on this historical pile."

In case some of your readers may misread this statement, may I say that under no conditions are ciné cameras allowed inside the Tower. "Still" cameras are allowed. I am writing this because I have seen several people warned about the matter.

Trusting that this will make the matter clear.—Yours, etc., D. BRENNAN.

## THE COMPUR SHUTTER.

SIR,—I would like to endorse the remarks of your correspondent BM/ZVTW in his reply to Mr. Green, who is of the opinion that the Compur shutter gives a kick that is detrimental to sharp photographs.

Personally, I have never experienced blurred negatives through camera movement during exposure. I find the Compur most reliable, giving perfectly sharp negatives, even when given exposures such as  $\frac{1}{2}$ ,  $\frac{1}{10}$ th,  $\frac{1}{5}$ th sec., etc.

As BM/ZVTW points out, such an obvious fault would surely have been discovered and rectified.

The popularity of the Compur shutter is in itself sufficient proof that it does its work efficiently.

In conclusion I would like to say that I have no interest in Compur shutters other than being a satisfied user.—Yours, etc., "COMPUR."

## OLD APPARATUS.

SIR,—For those readers who have not yet succumbed to the modern craze for miniature cameras, I would like to suggest that now is the time to acquire, second-hand, the older type of camera with that extra degree of perfection.

Those who have purchased a new miniature camera of the 35-mm. type will often be found willing to dispose of an older type, in most cases first-class instruments, to help defray the cost of the latest acquisition.

This is where the reader who wants a good camera comes in. The best means of tapping this source is by an advertisement in the "Wanted" column of "The A.P." This method (although few realise it, judging by the much greater number of "For Sale" advertisements), is preferable to watching advertisements or Sale Lists for the desired bargain to turn up as, when it does, you may be in competition with several others. By advertising yourself you eliminate competition, and will be able to con the offered bargains at your ease.

I can assure the bargain seeker he will be amazed and delighted at the number and variety of the replies. Do not make the advertisement too terse for the sake of saving a copper or two but leave plenty of latitude between the limits of your desires. You will be very hard to please if you are not satisfied with the result, and you will probably spend much less than you had anticipated (unless you do as I did, and buy two cameras).

Finally, when you do receive this consideration, don't forget to pass it on in the shape of your old camera at a reasonable price to encourage some other aspiring photographer for the sake of the best hobby in the world.—Yours, etc., T. LAW.

## "THE SHADOW ON THE SAND."

SIR,—I wonder how many of your readers noticed the peculiar appearance of the shadow in the picture "The Shadow on the Sand," by Forman Hanna, which appeared in the edition of July 24th, and it was surprising that it passed the keen eye of "Mentor" in his critical comments.

Although the model was bathed in brilliant sunshine, the extended arm which rested on the rocks cast no shadow, and the shadow of the whole body had a most unnatural appearance. One would have thought that so small a shadow in the midst of brilliantly-lit sands would have gathered some reflected light and would not have appeared much darker than the shadows in the crevices of the rocks. A closer comparison between the model and the shadow will reveal further peculiarities which give the "shadow on the sand" the appearance of not being the actual shadow of the model at the time of exposure.—Yours, etc., C. J. WILLIAMSON.

# Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

## Minimising the Effect of Varied Lighting

By "ACTINOGRAPHIST."

Variations in the lighting and in exposure will continue to effect detrimental changes in image quality—until such changes are regarded as being quite unnecessary. The following deals with some common causes of the trouble and suggests methods for their elimination.

A FEATURE that may be remarked in several recent productions by practical amateurs is a pronounced tendency for the image quality of the film to vary according to the nature and position of the illuminant employed. Undoubtedly, the popularity of panchromatic emulsions—which definitely emphasize the trouble where earlier emulsions actually conceal it—may have a great deal to do with this; but the fact remains that the trouble must be eradicated, and this can be done only in the shooting stage.

This problem of eradication may seem simple enough—until we remember that it is necessary to employ many different varieties of lighting according to the dramatic requirements of action. And whilst this means that the lighting may vary from scene to scene, it does not imply that we cannot dispense with that unevenness in image quality which almost invariably accompanies any great change in lighting conditions.

### Indoors and Outdoors.

Perhaps the greatest unevenness occurs where the illuminant itself varies with the action—as, for example, where interior and exterior shots are spliced in juxtaposition in the same film. Here the interior artificial illuminant has not the same great abundance of blue light which is encountered out of doors; and in order to eliminate the practical effect of this it is necessary to counteract the excess of blue in ordinary daylight.

The use of a filter may, in such instances, accomplish everything that is expected of it, so that the interior and exterior shots will show no offensive or even appreciable change of image quality. Filters vary tremendously in colour and power, but for ordinary work it is found best to keep to two or three that do little more than bring the quality of indoor and outdoor shots approximately to a common standard.

"Extreme" filters are especially to be avoided. Nor is the popular "Gamma" green suitable for the present purpose, since this cuts out the orange as well as the blue—and artificials contain an unusually high proportion of orange light.

The simplest possible effective plan is to use no filter whatever for indoor work, whilst two moderate depths of yellow and a pale green will accomplish all the "quality" filtering out of doors.

### Direction of Lighting.

Daylight, even when used by itself, can show great variability in its effect on image quality. This is because the shadows and contrasts change with the direction of lighting. For example, many *contre-jour* or against-the-light effects are spoilt through a well-known flatness quite out of keeping with the vigorous quality of adjacent images which are probably perfectly normal.

Fortunately, this flatness can be eliminated in all back-lighting close-ups and medium shots. All that is required is a brilliant reflector—which device will in no way detract from the fundamental purpose of the back-lighting itself.

Similarly, lighting from the sun creates what are known as bright and shadow sides, and these may show quality variations when images from both form adjacent splices in the film. The use of two or more reflectors (this time placed farther away from the

subject) will almost entirely avoid the trouble in the case of medium shots and certainly in the case of close-ups.

### Exposure.

Exposure as much as any other factor exercises some influence upon image quality. Old "rule-of-thumb" ideas and the time-honoured method of doubling the meter reading are too haphazard for the precise requirements of reversal processing. Despite a lot of unnecessary nonsense still said and written about the exposure "problem," any modern photo-electric meter will show at a glance the correct exposure for any "straight" subject under any condition of lighting.

Calculations of a minor character are, of course, necessary when mattes, filters and certain other devices are employed; but since each of these has its own "factor" there is little need for the amateur to worry further over this aspect of technical work.

Variations of the usual bathing scenes can be turned to good account by the amateur ciné worker. A good setting for such a picture is suggested above.

# Virgin Soil

By  
R. H. ALDER.

**J**USTIFICATION of the amateur lies in experiment. In craftsmanship the professional is bound to excel, for he does all day and day by day, under the stimulus of competition, what the amateur can do only from time to time in moments of leisure. But the latter, while learning the craft, can apply it, as the professional cannot, in new directions. He is not bound to satisfy the public's immediate demand. The ideal only is his master.

Some commercial enterprises deserve great credit for excursions into the field of education, which cannot be monetarily profitable like the golden acres of entertainment. But deep research into the application of films to teaching can never be vindicated on a revenue basis, though socially desirable. Here is one opportunity for the amateur to distinguish himself and to dignify his hobby.

## Lone Adventure.

Moreover, it is an opening for the unattached cinematographer. Clubs can be left to play at professionalism; what is needed in the schools is nearer to the single-handed and single-minded documentary. The ideal collaboration is that of a cinematographer who knows something about teaching, with a pedagogue who knows a little about cinematography. Between them they will make an irresistible vanguard of a great army.

The film, like broadcast, cannot supplant, but can supplement, the teacher's personal activity. The film runs to a predetermined rhythm; the teacher is flexible, and alters his presentation to suit circumstances. Some classes by a quirk of mass-psychology, are quick in the uptake, but poor in memory; in others the new idea must be hammered home, but is then fixed for all time.

## New Technique.

Clearly there is room for wide research into the actual technique of using the screen as a kind of animated blackboard. A delicate balance must be struck; the picture must aid, but must not replace, visual imagination in the pupils.

When preliminary conclusions have been drawn regarding the best methods of using films, there is a vast region of experiment in the actual construction of films for different subjects. Some degree of specialisation will be forced on us; no pair of investigators can hope to cover the whole curriculum. Although natural science for boys and domestic science for girls offer themselves as pre-eminently suitable for illustration, any school subject can benefit from visual aid.

Some subjects may at first seem to lie beyond the amateur's scope. The basis of geography, for instance, is to link maps with scenery, vegetation, geological formation and industry. To do this on a large scale seems impossible; one cannot afford to go to South America to make two hundred feet of film for one lesson. One can, however, dig through the library catalogues. Cuttings from "interest" films, imaginatively spliced with shots of maps and charts, can vividly show the relation of reality to "diagrams," and every teacher knows that the ready and accurate translation of conventional symbols into imaged reality is the main aim of education.

## The Whole Truth.

For this reason there can be no poetic licence in the school film. Accuracy, or rather truthfulness, is essential. "Documentary" is nowadays frequently used euphemistically for "propaganda." The educational documentary is wrecked if any bias is introduced into it. It

must be utterly factual. If keen young eyes once observe suppression of the truth they will not again look on the cinema as anything but fiction.

In the past, popular instructional films were often constructed on the "powder and jam" principle; extraneous humour was dragged in to make the teaching palatable. This is well enough for adults, but single-minded, logical youth will not endure it. Cinematic treatment must bring out the interest in the subject itself; all boys and most girls are consumed with curiosity about things unknown, and an understandable presentation of something new holds their attention.

## If Youth But Knew!

Worse even than false humour is patronage. The class may lack experience, but their intelligence is keen and perception still keener. Talking down to a boy antagonises him and never passes undetected. The cartoon film had no permanent success with children until it was made for adults.

These notes are nothing but signposts pointing out a path lightly trodden. At present it twists and turns round obstacles, some day it will be a broad highway in education.

## Service to Posterity.

One can foresee the evolution of courses of lessons, with living illustrations instead of the lifeless wall-charts of our own childhood—courses on which the schoolmaster will impress his own personality as he does on the textbook of to-day. That future will be vastly hastened if every amateur cinematographer finds a collaborator and attempts to make at least one short class-room film for circulation.

Is that too much to ask?

# A Competition specially for Novices

## SUBJECTS.

Prizes will be awarded for the best snapshots of family groups or single figures taken at home or on holiday, indoors or outdoors. The arrangement of the groups or the pose of the figures is left entirely to the discretion of the competitor.

The competition is open only to novices: those who have never won an award of any description in a photographic competition.

Entries are restricted to contact prints. The smallness of the prints, which may be mounted if necessary, will not affect their careful consideration in this competition.

## PRIZES.

The prizes will consist of supplies of roll film or of plates (if any winner happens to use a plate camera).

THE FIRST PRIZE WILL BE TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.

THE SECOND PRIZE WILL BE TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.

THE THIRD PRIZE WILL BE ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.

TWELVE PRIZES OF ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

The winners of these prizes will thus be encouraged to continue their photographic activities throughout the year with a supply of free film.

## RULES.

Each print must have affixed firmly to the back, a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor.

The latest date for receiving entries is September 7th, 1935. This will give new readers, who are novices, who intend entering this competition every opportunity of improving their work during the next few weeks by reading "The Amateur Photographer" every week and obtaining their competition prints during the summer holidays.

The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed as follows: The Editor, "The Amateur Photographer," Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices' Competition."

Further references to the competition will be made week by week, and hints given for the best treatment of groups and figures.

# Developing on board Ship in Hot Weather

**A**S a ship's officer, travelling at times in the Tropics, it has always been a problem developing at times when the tap water (or compactum water in older ships) rose much above 70 degrees.

Using iced water, which is easily obtainable on ships, often gave rise to reticulation, ruining negatives sometimes of unrepeatable pictures. Eventually a scheme was evolved which overcame all difficulties, and which will no doubt be useful to those going on ocean voyages or perhaps on cruises.

All that is required, with the exception of the chemicals and a thermometer, can be obtained on board. The steward, with an eye to his gratuity at the end of the voyage, will generally be found a useful ally, and will obtain a large can of iced water and a footbath such as are used in the bathrooms for fresh water, as well as three soup plates.

It is interesting to note that soup plates at all times form excellent developing dishes, not the least merit of which is that there are no corners, which in dishes are so difficult to clean thoroughly. Three beer bottles are also needed—easily obtainable in hot weather! These should be thoroughly washed out before use, and should preferably be of the screw stopper variety.

The chemicals consist of a small tube of pinacryptol green tablets eliminating the necessity of a safelight, "Tabloid" developer, and a tin of acid fixing salts. The tablets are crushed before solution by means of a toothbrush handle, or the bases of some makes of thermometer are specially strengthened for that purpose.

The solutions are made up in the bottles, which are then put in the bath of water, and the plates are put in the water, too. By the time everything is at the same temperature the water will have risen to a temperature at which developing can be commenced, though owing to the coldness of the water developing will take some time.

A plate is removed from the bath, a little desensitiser put in it, and after wetting the film thoroughly in the bath it is desensitised. This takes about a minute and is done in total darkness, and is best done at night.

The film is now removed to the hand-basin, containing a little water taken from the bath. The light, previously well shaded, is now turned on. Some developer is poured into another plate, floated in the bath, and developing commences.

When the film has reached the right amount of contrast it is removed from the developer and is again put into the basin, in some more water dipped from the bath. The plate of developer is removed, another plate is taken from the bottom of the bath, where it has been keeping cool, is filled with the fixer, and is floated as the other plate was for developing.

Great care must now be exercised not to drop any of this solution into the bath water itself, as this is to be used for washing the film afterwards. When fixing is complete the plate is removed from the bath and washing commences, in the basin, a little of the water being dipped into it at a time. By means of frequent changing of water this method of washing is as efficient as any.

A word of warning—do not attempt this process if the ship is rolling, or your little boats with their solutions will sink in the bath, contaminating your washing water, wasting the solutions and perhaps the films themselves. If film packs are being used a pair of thin long-nosed pliers are a handy tool for handling them, far more effective than many implements really meant for that purpose.

The films are wiped with wash-leather, the back of an old glove wetted and wrung out will do, and are hung up to dry.

In the more modern ships fans have been superseded by devices which blow fresh air into the cabin. These can be pointed in any direction at will. A good scheme is to send the air on to the bulkhead near the film, but not directly on it, and drying will be rapid.

L. J. C. KER.

## Photography in India

**P**HOTOGRAPHICALLY, the most backward country in the world until the last year or two has been India, according to Mr. Arthur Pereira. He built a film studio out there in The Deccan, and immediately his troubles began in the way of interference from the curious Indian. Hundreds of Hyderabaders tried to get into the enclosure in which the film was being made, and when denied, their recourse was obvious. Knowing that it was a talkie film, they made all the din they could, yelling and hooting in a way to make the sound track curl up.

At last the film studio capitulated and allowed the rollicking concourse

to come in, whereupon they became immediately silent and well-behaved. But, even so, there were Indian lads who seemed determined to cross and re-cross in front of Mr. Pereira's camera as many times as possible a minute.

Mr. Pereira had been warned not to take anything for granted in the way of photographic technique, and he took everything out with him that could possibly be required. The device for washing films is primitive enough—a cascade washer with three troughs built in concrete, each large enough to hold a frame. The native receives a frame from the developing-room, waggles it in the water of the first trough, passes

it to another, who does the same at the second trough, and he to a third by whom the operation is repeated, the film in the process receiving considerable damage from finger-nails.

The natives also have a fixed idea that for proper photography the bath must be at 65 degrees. In Bombay the temperature may be anything up to 100, and it is only on rare occasions that the bath can be got at 65, so what they do is to pour in ice in large quantities, so that the developer gets well diluted, and the film shows quite a surprising variety in tonal quality. Photography east of Suez can be rather short of joy.

# Readers' Questions ANSWERED

**GENERAL.**—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1." and in every case, without exception, must give the name and address of the writer.

**CONTRIBUTIONS.**—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

**ENQUIRIES AND CRITICISM.**—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

## Bromide Developer.

How can I prepare an all-round M.Q. developer for bromide paper? S. J. V. (Rugby.)

Start with, say, 15 oz. of hot water, dissolve the ingredients in the order given, and make up to 20 oz.

Metol	..	..	20 grs.
Hydroquinone	..	..	20 grs.
Sod. sulphite	..	..	1½ oz.
Sod. carbonate	..	..	1½ oz.
Pot. bromide	..	..	5 grs.

For use, take equal parts of stock solution and water.

## Hypo Alum.

Years ago I used hypo-alum for toning bromides, but although I know the procedure, I am not sure of the formula. Can you suggest one? P. S. (Wilmslow.)

Dissolve, in the order given, in about 30 oz. boiling water:

Hypo	..	..	5 oz.
Loaf sugar	..	..	1 oz.
Potash alum	..	..	1 oz.

Make up to a volume of 40 oz. and let it stand for a day or so with a few pieces of spoilt or old bromide paper in it to "ripen" it before use.

## Anhydrous Sulphite.

Is there any advantage in using sodium sulphite in the powder form instead of crystals? E. E. G. (Grantham.)

The cost is about the same, but the anhydrous form keeps better and dissolves more quickly.

## Cleaning Dishes.

What is the best way to clean white porcelain dishes from time to time? M. M. (Turro.)

Keep a bottle of this solution at hand; it can be used over and over again.

Potassium bichromate	..	..	4 oz.
Water to	..	..	32 oz.
Add slowly, sulphuric acid	..	..	4 oz.

Pour this into the dish, and run over the surface with rag tied on a stick. Pour back the solution and rinse the dish thoroughly under the tap.

## Bichromate Stain.

When bleaching negatives for chromium intensification how can I hasten the removal of the obstinate bichromate stain? Y. M. (Ipswich.)

There are several ways. After a preliminary wash place the negatives in a 5 per cent solution of potassium metabisulphite, and then continue washing.

## D. & P. Work.

I want to develop and print my own films. Will you tell me what I shall require? A. E. H. (Romford.)

We regret that we cannot undertake to give you a complete list of the things required for developing and printing, as this would far exceed the reasonable limits of a reply. Your only course is to get an elementary textbook on photography, and learn from that what are the requirements, and, not only so, but how to proceed. A mere list of apparatus and chemicals would not help you much.

## Removing Background.

In some prints of large heads I want to remove the whole of the background to make room for hand-work on the plain paper. How is this done? S. L. M. (London.)

Make up the following:

Ammonium bromide	..	..	25 grs.
Potassium ferricyanide	..	..	75 grs.
Water	..	..	5 oz.

On the dry print paint this round the outline with a fine brush. Bleach the rest of the background by using a large brush or a pad of cotton-wool. Wash quickly, fix in plain hypo and wash thoroughly.

## Glazing Trouble.

Using double-weight paper I can only get prints off the ferrotype plate while they are still damp. When dry, they stick. I have no trouble with single-weight paper. Could you advise me? W. L. L. (Ipswich.)

It is quite useless for you to remove the prints from the glazing slabs while damp.

We have had no trouble ourselves with double-weight papers, and they should not stick any more than do single-weight papers. As you say nothing about it in your letter we should advise you to give the prints three or four minutes in 10 per cent formalin after the final washing, and transfer them straight to the slab. It is quite possible that you are trying to remove the prints before the gelatine is thoroughly dry, as this takes much longer with a thick paper.

## Making Bellows.

Will you furnish me with a diagram showing how to fold bellows for an enlarger? F. G. H. (Wallasey.)

We regret that it is quite impossible for us to give you the necessary diagrams and instructions for bellows-making. This sort of thing used to be described occasionally many years ago, but is of little or no interest nowadays. The fact is that bellows to any specification can be obtained so cheaply that it is not worth while attempting to make them.

## Trouble with Focussing.

With my reflex camera the plane that appears sharpest in the mirror is not the sharpest in the negative. Why is this? J. A. B. (Edmonton.)

If you get a sharp image on the ground glass of your reflex, and it is not similarly sharp on the negative, something is evidently wrong. It is quite possible that the ground glass at the top of the camera is the wrong way up, and we should advise you to try the effect of reversing it.

## Exposure Meter.

Can you recommend an exposure meter, costing under ten shillings, for use with a V.P.K. with f/5.6 lens? S. M. C. (Wellington.)

We think you might well obtain a Watkins' "Bee" meter with the necessary accompaniments, as this comes considerably under the price you name. This is an actual actinometer, and we feel confident that it will do all you are likely to require, if you learn to use it according to the instructions.

## Enlarging.

Can I use 2½ x 2½ negatives in a quarter-plate vertical enlarger, or should I require a shorter focus lens? A. L. (Clevedon.)

There is no reason why you should not use the smaller negatives in your present carrier. The only real trouble you are likely to meet is the limit as to size of enlargement. You do not say whether your enlarger has automatic focussing, but, if so, you will upset this by using a shorter focus lens. Otherwise, a shorter focus lens will be an advantage.

## Making Block.

Will you tell me how to make a zinc block by photographing an original drawing and then etching a plate? G. J. J. (Woking.)

The question of making a zinc block is not one that can be dealt with briefly. It is a highly technical matter, and does not come within the scope of amateur photography. You will find in the issue of July 31st, under "News and Reviews," a brief reference to a book on how a block is made, and if you get a copy of this it gives you a very good outline of the process.

# THE London Salon of Photography 1935.

**SENDING-IN DAY, Wednesday, September 4th.**

THE TWENTY-SIXTH EXHIBITION promoted by the Members of the London Salon of Photography will be held at The Galleries of the Royal Society of Painters in Water Colours, 5a, Pall Mall East, London, S.W.1, from SATURDAY, 14th September, to 12th October, 1935.

## CONDITIONS OF ENTRY (Please read carefully).

- No. 1. Pictures from exhibitors in the British Isles must not be framed; but may be mounted. Each picture must bear on the back, clearly written—(a) name of artist; (b) number and title of picture; corresponding to particulars on the Entry Form.
- No. 2. When mounts are employed, they should conform to the following sizes—25×20, 20×16, or 15×12, but no mount to exceed 25×20; and it is suggested that white or light-toned mounts be employed wherever possible.
- No. 3. Pictures from abroad must not be mounted (or framed), but should bear full particulars as above.
- No. 4. Pictures which are sent unmounted will be suitably mounted by the Salon Committee, and all accepted pictures will be shown under glass.
- No. 5. All pictures should be sent by parcels post, packed flat, and properly protected with stiff cardboard and adequate wrappings, addressed to: THE HON. SECRETARY, THE LONDON SALON OF PHOTOGRAPHY, 5A, PALL MALL EAST, LONDON, S.W.1.
- No. 6. The sending-in day is Wednesday, September 4th, 1935. All pictures for the Exhibition must arrive at the above address on or before this date. Exhibits may be delivered by hand at the Gallery on this date only.
- No. 7. The Entry Form, properly filled in, must be sent with the pictures, together with entry and packing fee of 5/- (this fee covers any number of pictures from one exhibitor).
- No. 8. To avoid Customs complications, all entries from without the United Kingdom must be sent by post and without prices marked on the prints. Packages containing such entries should be clearly labelled: "PHOTOGRAPHS FOR EXHIBITION ONLY. NO COMMERCIAL VALUE. TO BE RETURNED TO SENDER."
- No. 9. All pictures sent by post will be repacked and returned carriage paid, after the close of the Exhibition.
- No. 10. In view of application being made from time to time to The London Salon of Photography for permission to reproduce pictures from the walls of the Gallery, exhibitors are asked to signify on the Entry Form whether they have objection to such permission being given. The copyright, in all cases, remains the property of the authors of the prints.
- No. 11. The Committee assure intending exhibitors that the utmost possible care will be taken of all work submitted, but they do not accept any responsibility for loss or damage, either during transit or at the Gallery.
- The submission of pictures will be understood to imply acceptance of the above conditions.
- Due notification of acceptance of pictures will be sent out as soon as possible.
- All correspondence must be addressed to the Hon. Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.

**Readers of The Amateur Photographer & Cinematographer** who are preparing work for this year's Salon may use this page as an ENTRY FORM.

## SEE CONDITIONS.

**Intending Exhibitors** who are unable to secure extra Entry Forms in time may prepare their own on plain paper provided the conditions of Entry are adhered to.

## FORM OF ENTRY.

TO THE HON. SECRETARY, THE LONDON SALON OF PHOTOGRAPHY.

Sir,—I beg to submit the undermentioned Photographs for the consideration of the Selection Committee, and I enclose Postal Order of the value of 5/- to cover Entrance Fee and the cost of return postage (see conditions 7, 8, and 9).

Reg. No. (leave blank).	A, B or C (leave blank)	Number on Picture.	Title of Picture.
		1	
		2	
		3	
		4	
		5	
		6	

The attention of exhibitors residing in countries outside Great Britain is specially directed to Condition No. 8.

I AGREE  
TO CONDITION 10.  
YES OR NO.

Name.....  
(State Mr., Mrs., or Miss)

Address.....

## Business Notices

### Publishing

**OFFICES.**—Dorset House, Stamford Street, London, S.E.1. Telegrams: "Amaphot, Sedist, London." Telephone: Hop 3333 (50 lines).  
**PUBLISHING DATE.**—"The Amateur Photographer and Cinematographer" is on sale throughout the United Kingdom every Wednesday morning.  
**SUBSCRIPTION RATES.**—British Isles 17/4 per annum, Canada 17/4, other countries abroad 19/6 per annum, post free.  
**REMITTANCES.**—Cheques, etc., should be crossed and made payable to Iliffe and Sons Ltd. "The Amateur Photographer" can be obtained abroad from the following: **UNITED STATES:** The International News Co., New York. **FRANCE:** W. H. Smith & Son, 246, Rue Rivoli, Paris; Hachette et Cie, Rue Reaumur, Paris. **BELGIUM:** W. H. Smith & Son, 71-75, Boulevard Adolphe Max, Brussels. **AUSTRALIA:** Gordon & Gotch, Ltd., Melbourne (Victoria), Sydney (N.S.W.), Brisbane (Queensland), Adelaide (S.A.), Perth (W.A.), and Launceston (Tasmania). **NEW ZEALAND:** Gordon & Gotch, Ltd., Wellington, Auckland, Christchurch and Dunedin. **INDIA:** A. H. Wheeler & Co., Bombay, Allahabad and Calcutta. **CANADA:** Imperial News Co., Toronto, Winnipeg and Vancouver; Benjamin Wells Co., Montreal; Gordon & Gotch, Ltd., Toronto. **SOUTH AFRICA:** Central News Agency, Ltd.

### Displayed Advertisements

Communications on Advertisement matters should be addressed: The Advertisement Manager, "The Amateur Photographer and Cinematographer," Dorset House, Stamford Street, London, S.E.1. Copy for displayed advertisements for the issue of any particular week must reach Dorset House by the first post on Tuesday morning in the week previous. Rates and conditions will be sent upon application.

### Prepaid Advertisements

**SALE AND EXCHANGE: AMATEURS ONLY—**  
 12 words or less ..... 1/-  
 1d. for every additional word.  
**PROFESSIONAL AND TRADE:—**  
 12 words or less ..... 2/6  
 2d. for every additional word.

Each paragraph is charged separately.  
**SERIES DISCOUNTS** are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.  
 All advertisements inserted in these columns must be strictly prepaid and posted to arrive at the Head Office, Dorset House, Stamford Street, S.E.1, not later than first post FRIDAY for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 26, Deansgate, Manchester, 3; 26a, Renfield Street, Glasgow, C.2.

Advertisements are inserted, as far as possible, in the order received, and those received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders sent in payment for Advertisements should be made payable to **ILIFFE AND SONS LTD.**, and crossed

& Co.

Notes being untraceable if lost in transit, should not be sent as remittances.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

**BOX NUMBERS.**—For the convenience of advertisers, letters may be addressed to numbers at the office of this paper. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charges, which must include the words: "Box 000, c/o 'The Amateur Photographer'." Replies should be addressed: "Box 000, c/o 'The Amateur Photographer,' Dorset House, Stamford Street, London, S.E.1," and these letters will be simply forwarded by us to the advertiser. It must be understood that we do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisement. Readers who reply to Box No. advertisements are warned against sending remittances through the post except in registered envelopes. In all such cases the use of the "Deposit System" is recommended.

### Special Note

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

### Deposit System

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Amateur Photographer and Cinematographer," both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10 a deposit fee of 1/- is charged; on transactions over £10 and under £50 the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, one-half per cent. All deposit matters are dealt with at Dorset House, Stamford Street, London, S.E.1, and cheques and money orders should be made payable to Iliffe and Sons Ltd.

## CAMERAS AND LENSES

**ETUI**, 4-pl., Zeiss f/6.3, with 6 slides, double extension, perfect and new condition, offers.—Hurner, Kinniel, West End Avenue, Pinner. [8499]

**LEICA III**, f/3.5 Elmar, new and perfect, £19/10.—Saville, c/o P.O., Walham Green, S.W.6. [8681]

**HOMEOS** Stereoscopic Outfit (cine film used), £11/11.—Delagrave, 21, Porthall Rd., Brighton. [8736]

**PRESS** Reflex, Zeiss Ernemann Mirror Reflex, f/1.8, 10.5-cm., focal-plane 1/20th to 1/1,200th, 6 slides and F.P.A. for 4.5×6 cm., yellow filter; list £49; sell £12; no lower.—L. W. Reinken, Kolster-Brandes, Sidecup, or phone Sidecup 1188. [8742]

**NETTEL** 3½×2½ Self-capping Focal-plane Press, speeded 1/10th to 1/1,200th sec., 11 single metal slides, black leather case, Cooke Series II f/4.5 anastigmat, rising and cross front; good condition, £7/10; deposit system.—14, Ash St., Heywood, Lancs. [8743]

**ENSGIN** Auto-Range 3½×2½, coupled range-finder, f focal-plane shutter, automatic film winding, f/3.5 lens, rising, cross front, cost £17/10, for £10/10.—Below.

**PALMOS** Press 3½×2½ Focal-plane, f/2.7 Tessar, 3 D.D. slides, F.P.A., hood, case; perfect, cost £35, for £11.—27, St. Giles, Norwich. [8745]

**SOHO** Reflex 4-pl., Ross Xpres f/4.5, 3 D.D. slides, film pack, £11; Folding Ernemann 4-pl., central and focal-plane shutters, Tessar f/4.5, slides, £5.—Allbutt, 55, Upperton Gardens, Eastbourne. [8747]

## WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

## CAMERAS AND LENSES

**ROLLEIFLEX** Automatic 2½×2½, Tessar f/3.8, 2 filters, Proxar set II, lens hood, ever-ready case; best condition, £20.—4, Cornwall Avenue, Finchley, N.3. [8749]

Ever-Ready  
Leather Case,  
5/- extra.

Yours for 5/3 down and 11 similar  
monthly payments.

The New "AVO" Photo-Electric  
Cell Meter ensures Correct  
Exposure EVERY TIME

### EXCLUSIVE FEATURES

1. Equally suitable for "Still" and Ciné cameras.
2. Adjustment provided for plate and film speed.
3. Direct reading—no calculations whatever.
4. BRITISH MADE.

### What a customer says :

"Many thanks for prompt dispatch of the 'Avo' Meter. I have now tried this and am definitely keeping same. It is certainly superior to other meters costing considerably more. I enclose herewith cheque—having deducted the allowance quoted on my old meter, which, by the way, I consider very generous. (Signed) Dr. —"

(Original may be seen.)

See what your unwanted meter is worth. Let us make you a SUPER ALLOWANCE.

### DEALERS & PROFESSIONALS PLEASE NOTE!

We supply the "Avo" at full trade terms, immediate delivery.

### POST THIS TO-DAY.

Please send me full details of the 'Avo' Exposure Meter, in which I am interested. Also please quote me, without any obligation on my part, your highest Super Allowance on my present meter, which is a

## CINEMATOGRAPH APPARATUS

### Trade.

6/- The Illustrachrome Multi-colour Wheel will enable you to give your movies in a fully professional manner by introducing delightful chromatic and atmospheric effects. You can present your feature opening with a blaze of glorious multi-tinting and then throughout the subject create a sense of reality that you have never before enjoyed. Then at the end pass from sunset to twilight in restful conclusion, you will be more than satisfied with the knowledge that you have given a perfectly artistic presentation by employing this aid to better movies. To fit all projectors, including the B-200, 6/-.—An Illustra product.

ILLUSTRA-LIGHT Set for Pathe Baby Projectors will enable a 6-foot picture to be shown with ease; no heat problem in spite of brilliance secured.

THIS Illustra offering uses a new type lamp and highly-efficient reflecting device, new type condenser and the whole in a lantern of same diameter as original, 1-in. longer; fitting takes but a few seconds. This set is supplied in 8 models: Type A, for use with 12-volt accumulator, 40/-; Type B, for use with A.C., 60/-; Type C, the universal model for A.C. or D.C., 65/-.—An Illustra product.

EVERYTHING for Movies.—Cameras, Projectors, Films, Screens.

NOT a Shop, a warehouse packed with cine equipment; no catalogue is available of bargains far too numerous to list, therefore, if in London, your inspection is invited.

ILLUSTRA ENTERPRISES, one address only, 159, Wardour St. (facing Film House), Oxford St. End, London, W.1. Ger. 6889. [8266]

# HAND CAMERAS

By R. Child Bayley

THIRD EDITION

An outstanding feature of this book, which makes a special appeal to all amateur photographers, is a number of separately printed plates, all from hand camera negatives by the author. These are selected to show the very wide range of subjects accessible to the snapshotter, from pure landscape to telephotographic portraiture.

Though primarily written for the beginner, "Hand Cameras" contains much of interest to the advanced worker, and should be in the working library of all who would attain to the highest degree of artistic excellence in their work.

**EXHIBITION PRINTS**

DEVELOPED WITH

**"FESAGOL N"**

Which automatically compensates for errors in exposure,

**WILL BE PERFECT**

**With "FESAGOL N" exposure is almost unimportant**

"The Amateur Photographer" says:—

"Remarkable latitude in exposure and development without staining for prolonged development or poor colour for shortened development."

"Only difference between full and barely adequate exposures was the length of time in development. The final results in each case being excellent."

**YOU WILL GET PERFECT RESULTS AND NO WASTED PRINTS**

To make 90 oz. **3/2**

Obtainable from all Dealers

# THE BEST HOLIDAY CAMERA SERVICE

"Why do they claim their service as best?" you may ask. Well, we always have the best selection of modern still and cine cameras; we are always willing to give sound advice and to demonstrate to you the working of any instrument. We offer the best allowance on your used camera, and we give service after purchase in the form of free periodical aids and literature to all who register their cameras with us. Try Bond Street for your next camera—and, don't forget, WE are the Leica specialists!

## SEND IN YOUR BEST SNAPS AND WIN 10 GNS!

Holidays offer infinite scope for getting ideal prize-winning snaps, and as long as they contain human life interest they can be entered in

### Wallace Heaton's "LIFE PHOTOGRAPHS" COMPETITION

No entry fee, no restrictions. Send in as many efforts as you like, but don't forget to put your name and address on the back of each one.

FIRST PRIZE SECOND PRIZE THIRD PRIZE  
**10 Gns 5 Gns 2 Gns**

Hundreds of prizes of 10s. 6d.

(Winning negatives become our property.)

## FREE LISTS

We have a special catalogue to cover every one of your cine and photographic needs. One each for Ciné Apparatus, Cameras, Bargains and Sundries. Send 2d. postage for any or all you need. They are the best guides for choosing your holiday camera.

A Customer writes:  
London, N.1.  
29/34.

"I cannot find words to express my very great satisfaction with the outfit, and with your promptness in executing the order. I solemnly assure you that should I, or any of my friends, ever require anything in the photographic line, we shall get the 'best of all at Wallace Heaton'." C. A. M.

... and you do  
**BEST OF ALL at**

## NEW SUPER IKONTA

Takes 11 exposures on 3½" 2½" 8-exposure Roll Film. Double exposures impossible. Zeiss Ikon latest pattern rotating wedge distance meter coupled to lens focusing. Rapid Compur shutter. Modern die-cast body. Elegant construction. With f/3.5 Zeiss Tessar lens

**£25 : 5 : 0**

Nine monthly payments of 59/-.

## FOTH-DERBY

Takes 16 pictures on standard V.P. Roll Film. Very light and compact. Fitted with Foth f/3.5 or f/2.5 anastigmat and focal-plane shutter, giving instantaneous exposures from 1/25th to 1/500th sec., also Time exposures. Delayed-action movement fitted to the shutter allows the operator to be included in the picture. Fitted with new type view-finder.

Foth f/3.5 lens.... **£5:5:0**

Foth f/2.5 lens.... **£7:5:0**

Nine monthly payments of 12/3 or 16/11.

## ENSIGN DOUBLE-8

With ENSAR f/4.5 ANASTIGMAT. 16 pictures on V.P. (Size 27) Film. Hinged back. 3-speed Everest shutter, depth-of-focus scale, direct optical sighting view-finder. Fits comfortably in pocket or handbag. Remarkable value. Price, including leather slip case... **£3 : 12 : 6**

Nine monthly payments of 8/8.

## ZODEL LENS HOOD

(Patent applied for) allows you to take pictures almost directly into the sun. Combining portability with light weight and the greatest possible measure of protection. Telescopic and folds flat for carrying. Eliminates internal reflections from the camera bellows, and ensures brighter pictures. Adjustable screw fixing. In two sizes: "A," to suit lenses from 1 to 1½ in. diameter; "B," for lenses from 1½ to 2 in. diameter. 7s. 6d. each.

Filter Rings, 2s. 0d. each.

## ROLLEIFLEX

The fastest roll-film mirror reflex in the world. Easily manipulated. Takes 12 pictures on 8-exposure 3½" 2½" roll film for 1/2". Fitted with Zeiss Tessar f/3.5 lens and Compur shutter speeded up to 1/500th sec. .... **£22:10:0**

Nine monthly payments of 52/6.

As advertisements on these covers go to press a fortnight in advance some of these second-hand items may be sold already, but similar outfits are usually available.

No. 2441.

## A Rolleiflex Picture

Do you have to divide your attention between the baby and the camera? This is a disadvantage of ordinary cameras which leaves success entirely to chance.

With Rolleiflex there is no need to look up from the camera—you can see the baby all the time on the ground-glass screen—you can watch all his facial expressions through the view magnifier—he looks up—he smiles—click!—got him!—and you know that your picture is perfect. Simplicity in manipulation is a big Rolleiflex feature. It has one-lever Compur shutter, speeded to 1/500th sec., also Time and Bulb, and f/3.5 Zeiss Tessar lens. Takes 12 pictures on  $3\frac{1}{2} \times 2\frac{1}{4}$  8-exposure roll film for 1/-, or may be adapted for plates . . . . . £22 10 0

See it at your dealers, or write for free brochure and name of nearest stockist from the sole importers:

**R. F. HUNTER LTD., "Celfix House," 51, Gray's Inn Road, London, W.C.1**  
Phone: HOL. 7311/2.

*Let's talk about*

No. 2 of an explanatory series describing the finest all-purpose film in the world

## COLOUR SENSITIVITY

'Panatomic' is coated with a fast panchromatic emulsion which is almost evenly sensitive throughout the spectrum, well into the orange and red. Its superiority in giving correct monochrome renderings of coloured objects is illustrated by the following comparative diagrams :

'Panatomic' gives you pictures of vivid truthfulness and brilliant quality

## THE MOST BEAUTIFUL PAPER EVER PRODUCED

Write for  
GEVALUXE VELOURS

Leaflet

GEVAERT LTD. - WALMER ROAD - LONDON, W.10

## for Enlargements from your holiday negatives

The most beautiful paper ever produced, for grainless enlargements from even the smallest of negatives. The surface has the appearance of black velvet, yielding prints of a depth hitherto unknown, with rich luminous shadows and a scale of gradation of extreme range.

For the special print—and all others. GEVALUXE gives life and beauty to all types of subject. As simple to use as an ordinary Bromide paper and as suitable for contact as for enlarging work. The results will delight you. If you do not make your own enlargements, stipulate that your Dealer uses GEVALUXE.

# ENGLAND'S LARGEST SELECTION OF MINIATURE CAMERAS

Every miniature camera of distinction is to be seen at our showrooms, including, of course, all the newest arrivals in the world of miniature photography. # Rolleicord

PICTURES DO NOT NEED ENLARGING

The Rolleicord saves you the expense of enlargements because contact prints are large enough to show the fullest detail of your pictures. The separate viewing lens and focussing screen eliminate useless snapping because you see your picture full size and right way up, therefore you can reject all subjects which do not appeal to you *before* you have wasted film on them. The high-class f/3.8 Zeiss Triotar lens will not only give you perfect holiday pictures, but will give excellent results all the year round. The Compur shutter is speeded from 1 second to 1/300th, also T. and B., and is set and released by one lever. The Rolleicord is so designed that it is one of the most easily manipulated cameras on the market.

This is the actual size of a Rolleicord picture. You get 12 like this on a  $3\frac{1}{2} \times 2\frac{1}{4}$  roll film for 1/- Rolleicord, with f/3.8 Zeiss Triotar lens and leather-covered body (can be adapted for plates in addition to roll films), £12 15s. There is also the metal-body Rolleicord with Zeiss Triotar f/4.5, for roll films only, £10 10s. Any apparatus exchanged—generous allowances. **EASY PAYMENTS**—the first monthly instalment entitles you to your Rolleicord.

## NATURAL COLOUR PHOTOGRAPHY

**N**ATURAL colour photography is now available to all photographers without the use of special apparatus and at very little extra cost. Dufaycolor Roll Films and Film Packs are as simple to use as ordinary films, yet without the use of special filters they produce transparencies in beautiful natural colours. On sale at all approved Ilford dealers.

**N**ATURAL colour photography is also available for the amateur cinematographer for 16 mm. cameras. Dufaycolor cine film is sold in 50 feet and 100 feet daylight loading spools. No additional attachments are required, but a plain single-colour daylight compensating filter is supplied free with each carton of film.

WEDNESDAY, AUGUST 21ST, 1935.

Copyright—Registered as a Newspaper  
for transmission in the U.K.

VOL. LXXX. No. 2441.

FOR many years past there have been more or less successful attempts to produce roll and pack films which will produce, on exposure, not negatives but positives in natural colours. At last it is possible to say definitely that an excellent film of the kind—the Dufaycolor—is available, this being now marketed by Messrs. Ilford Ltd., who have also organised a special department for processing the film. We should advise all who try the film to avail themselves of this service, at any rate at first. Not only are the results very beautiful things to examine and exhibit, but the films will certainly be in demand for the production of lantern slides, as nothing so perfect and so cheap can be secured by any other means. Without claiming any special gift of prophecy, we can safely predict the appearance of special projectors for showing these colour pictures in the home. Such apparatus should be comparatively simple and cheap, and the "home movies" must be prepared for the advent of a powerful rival. An article elsewhere in this issue explains simply the principles of Dufaycolor, and we shall of course deal further with the process from time to time.

### The Camera in the Tropics.

A little manual on photography in the Tropics has just been issued in Berlin which includes a large number of illustrations, practically all of them, so far as we can see, indicating how not to do it. That is a very excellent method of illustration, one that this journal has tried to follow to some extent in its weekly criticism of readers' prints. It is sometimes said that exhibitions (which, of course, are of work of a very high standard) are

## TOPICS of the Week

### A Weather Forecast

FOR THE WEEK

By D. K. BARTLETT.

#### THURSDAY, AUGUST 22nd.

The weather conditions will now improve to a good deal of sunshine and warmer temperatures, but fog and coastal mist is likely, particularly in the South-West of England and Ireland, also off the North-East Coasts into Scotland.

#### FRIDAY, AUGUST 23rd.

A good deal of sunny and bright weather can be expected, so plenty of opportunity should occur on this day for all kinds of photographic work.

#### SATURDAY, AUGUST 24th.

Although mainly bright, and some good sunshine records will be obtained, considerable coastal mists are expected, or a hazy atmosphere, spoiling attempts at long-range pictorial work, off the South-West and East Coast of Scotland in particular.

#### SUNDAY, AUGUST 25th.

Brighter atmospheres, fairly warm temperatures and long, sunny periods, although some cloud can be anticipated over large areas of England, Ireland and Scotland. The North-Western Coasts of Wales to Scotland and Northern Ireland may be cooler, but vision should be better, if anything.

#### MONDAY, AUGUST 26th.

Mainly fine and warm weather will occur, although the Western Coasts from Wales into Scotland will be cooler. This is not likely to spoil photographic work, however, since the atmosphere will be fairly clear.

#### TUESDAY, AUGUST 27th.

Continuing mainly fine and bright generally, becoming cloudy across from the South-East, spreading Northwards through the Midlands during the evening.

#### WEDNESDAY, AUGUST 28th.

Rather more cloud and thundery weather conditions are to be expected in the South-East of England with some rain locally, but generally some sunny periods can be anticipated in all parts.

useful for teaching purposes, but in moments of cynicism we sometimes wonder whether as a result of seeing good work more people are not led to despair about their own work than are inspired to improve it. An exhibition of failures and mistakes, perhaps with prizes for visitors who could best discover wherein the failure or mistake consisted, would be useful if not socially popular. It is interesting to notice the German technique for getting pictorial effects in the Tropics. Some really fine cloud studies over a burning landscape were obtained at eleven in the morning, with the stop at 25, an exposure of one-fifth of a second, and the use of a yellow filter. Some complicated tropical vegetation yields a passable result at  $f/4.5$ , with one-twentieth of a second, and again a yellow filter. One group of shining natives was taken at  $1/275$ th of a second, with the stop at  $f/4.5$ , and with the yellow filter, but the result was under-exposed, and much more detail was got in the African faces with the same stop and an exposure of  $1/100$ th of a second, but with no filter, the group being screened as much as possible.

### Photographing in Abyssinia.

Abyssinia, if it becomes a theatre of war, will be less than ever a paradise for the photographer. It is a country with quite splendid opportunities in the way of subjects, especially animals and birds—the country of the lion and the leopard, the giraffe and the zebra, with the crocodile, having consumed his prey, basking on the bank with his mouth open while birds pick the shreds of food from between his teeth. But the country has many disadvantages alike for "civilised" warfare and

for photography, civilised or otherwise. It includes some of the hottest corners this side the nether regions, and water is often scarce and, when found, unusable. Mr. L. M. Nesbitt, who explored Abyssinian Danakil with a camera a few years ago, and published a tale of heroic travel, had three of his servants murdered, and had to pass through almost incredible dangers and privations. And then when he was on the point of getting a good subject other difficulties intervened. For example, the Sultan of Danakil interviewed the travellers and at the end of a day's social intercourse he was politely requested to allow himself to be photographed. His unanswerable reply was that he could never do what his father had never done before him. That put a stop to the matter. Mr. Nesbitt spent some time photographing the remarkable tombs of the country only to be wildly reproached for having supposedly violated the dead.

### Filming at Fires.

People who watch the fire brigade rush through the streets of London are accustomed to see, first of all the escape, and in a moment or two the engine. But it seems that presently they will await a third vehicle proceeding in similar haste, namely, the trolley carrying the cinematograph apparatus. The London County Council is establishing a fire brigade film service. The members of the fire brigade, of course, have exceptional opportunities for obtaining cinematograph films of interesting and spectacular fires. The only drawback is that it is their duty to put the fire out as soon as possible. But it is felt that, while paying due regard to that duty, some very instructive and historical films might be taken. Up to now it has been the practice of the fire brigade to notify three approved firms by telephone when important fires are in progress, but the operators, in the nature of the case, usually arrive

too late to take photographs of the conflagration at its most picturesque point. While a fire as a photographic subject can be very interesting when the blaze is beginning, it is apt to lose detail when the blaze is at its height, and when it has died down nothing could be more unlovely than the picture it presents. The L.C.C. accordingly has been in negotiation with one of the film companies for its co-operation in the formation of a fire film service. An agreement has been reached whereby the company will train the brigade staff in the use of a film camera and the taking of films, will develop the negative, and supply one print in "silent" form, and as a part consideration for developing the film will make such use as it desires of it for newsreels, subject to that part of the film being approved by the chief officer of the brigade, the copyright of the film remaining the property of the council.

## READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with on this page week by week. Other replies appear as usual on the last page.

### A Direct View-finder.

*I have a rather old folding camera for plates, and I want to fit a frame finder to it. I can do the mechanical work quite easily, but I am not sure about dimensions, position of the parts, and so on. Can you give me an idea of these points?*

E. L. S. (Birmingham.)

As in many cases of questions we receive you do not give the particulars necessary for us to give a definite and detailed answer. You do not even state the size of the plates used, and "folding" cameras are of many types.

It is often possible, however, as now, to state the fundamental principles involved, and these can be modified and adapted, as necessary, to meet the particular requirements.

A good plan is to make a diagrammatic drawing of the main parts of the camera as suggested by the diagram herewith, and this may be drawn full size to facilitate measurements. In the sketch the full-size wire frame is attached to the front of the camera, and is indicated by the line A. On this line is marked off the length of one of the dimensions of the plate—say, the height when it is taken the horizontal way.

The height so marked is bisected, and a line drawn at right angles till it meets the

line C, which is exactly above the plate, and indicates the position of the sighting pin. The end of the horizontal line gives the centre of the peephole, which may be a circular hole, or a small rectangle. The other dotted lines are drawn to show the angle included, these being drawn to the two points showing the height of the plate.

The point to grasp here is that similar lines drawn from the stop in the lens to the top and bottom of the plate would give a similar result, but turned the other way round. That is, looking from the peephole in the sighting pin to the frame of the finder, is the same as looking from the stop to the plate. Care must be taken that the finder view is unobstructed by any part of the camera body, as shown in the sketch, and this may involve raising the rectangular frame of the finder some distance above the camera front.

Now suppose that you do not fix your frame on to the front of the camera, but on to the body, as shown by the line B. The diagram at once shows that the height of this line included between the dotted lines meeting at C is now the height of your frame. It is obviously no longer full size, and the farther back you put it the smaller it will become. This shows why direct finders with the sight very close to the frame are always small, and in these cases a rectangular "lens" is often fitted into the frame instead of leaving it open.

Having found in this way one dimension of your frame according to its position, another simple diagram will give you the other dimension. This is shown in the second diagram, at the bottom. The outer rectangle is drawn the same size as the plate, and the two diagonals drawn as shown. The upright dimensions of the finder are placed so that the ends of the lines (parallel with the outer rectangle) fall on the diagonals, and these points being joined, the exact rectangle of the finder frame is shown. This holds good for any position in which it is found necessary or convenient to place it.

# Exposure and Roll Films

In using roll film the question of exposure is of the greatest importance if the best average results are to be secured. Means to this end are suggested in the following article.

THE question of exposure is always an important one in the realm of photography, and many pictures are ruined each year by incorrect exposures, but the problem in relation to the roll film is even greater, and needs an extra amount of attention on the part of the amateur.

Now that roll films can be obtained in so many and varied emulsions, the tendency to wander from one make to another is to be deprecated, because until the worker has perfected a system of producing a suitable negative for his particular purpose he should irrevocably master one form of material first.

Miniature cameras and "sixteen-on types" have popularised not only the roll film, but also the roll-film developing tank, usually of the daylight-loading type. It is quite understandable, since these tanks are both trouble-free and time-saving, and, given careful attention, will produce sparkling negatives—up to a point. Here the question of exposure enters the field with vigour.

## A Day's Exposures.

Let us take an average eight-exposure roll film being used on holiday. Observe the amateur setting off with his camera in the early part of the day. He takes a couple of pictures of the early-morning deserted beach—plenty of light, no fine detail to register, a subject almost certain to be adequately exposed.

At midday he comes across a crowd of bathing belles, a couple of exposures on these in a blazing sun on a wet sand; almost certain to be a little over-exposed.

In the later part of the afternoon he visits the near-by cathedral, here to be intrigued by the intricate Norman doorway, with its fine detail and strong contrast of light and shadow. He enters, exposes one on the beautiful chancel, where the contrasts are decidedly weak. After tea he wanders about until

he feels that he must expose a film on the sunset, so he finishes the film in the red light of evening, almost certainly with at least a minimum exposure.

## Plate Development.

Now let us suppose him in the position of the plate user. He would settle in his dark-room, and with each different class of subject he would use an appropriate method of development. For his slightly over-exposed subjects he would cut down his development time; his interior subjects would probably be treated by the water-development system, and his sunset scenes removed from the developer before they became too contrasty.

## Film Development.

The roll-film man proceeds in a very different fashion. Even if he develops by inspection he puts the whole film through the same developer for the same length of time. Granted, he can, should he so wish, cut up his film into single exposures, but it is seldom the ordinary film worker resorts to such a tricky business. More probably he puts the roll into a tank, fills it with a suitable developer, gives it a certain time in this, rinses, fixes and washes it, and then hangs it up to dry. And what are his negatives like? It is obvious that if his time of development has just suited one particular type of negative recorded on the film, then all the others are, more or less, wrongly developed. If, shall we say, his development just suits his early-morning subject, then his noonday exposures will have the high-lights clogged up, his interior will be too thin to give a decent print, even on vigorous paper, his detail work in the doorway will be lacking some of the finer points.

Intensification and reduction of individual negatives can, of course, be resorted to, but no photographer resorts to these processes if he can possibly avoid them.

How, then, are these complica-

tions to be avoided? An important question for the eight-exposure man, still more so for the sixteen and thirty-six exposure one. Well, one method is to take a leaf out of the cinematographer's book, and use one shutter speed—except in the cases where action forbids it—and to use the diaphragm according to the light at the time of exposure. This will, of course, only apply to those who have large-aperture lenses, and therefore the worker with a smaller aperture must have some other means.

## Using a Meter.

First of all, an exposure meter of some kind is a necessity. "But they are not reliable," you say. Well, that is not entirely the point; the thing is that they set a standard on which you can build. Once the idiosyncrasies of your particular meter are understood they can be allowed for.

With the exposure meter a small notebook, in which is noted carefully the vagaries of the exposure meter, both for exterior and interior work, then the difference between those scenes taken in very bright sunlight and in other circumstances can be noted, with any remarks. These can only be found out by trial and error.

## Standard Negatives.

It will be seen that now there is no reason why all the negatives on the spool may not be of the same density, that is, of course, speaking generally. Special subjects must, of course, be treated in special ways, but general holiday work will respond to this treatment.

A great saving in time and material is effected by aiming at a standard negative. Enlarging is simplified, the exposure for the negatives being approximately similar, there is no need to have a number of grades of paper, and if contact prints are the order of the day suitable negatives can be made to facilitate the printing thereof.

# Sunshine & Shadows

By **BERNARD ALFIERI, Jun.**

**B**RILLIANT contrast and heavy shadows help to make striking pictures, providing care is taken to apply them to the right subject. Broadly speaking, the brighter, and therefore the harder the light, the faster the plate or film that can be used in order to gain detail in the shadows, and avoid excessive contrast in the high-lights.

Strange as it may sound, a far more striking result may be obtained on a very rapid (preferably panchromatic) plate or film in direct sunlight, than a slower, more contrasty plate, and if a small stop is not required, the excessive sensitivity of the plate may be counterbalanced by using a quick shutter.

It is often a distinct advantage to have a really dark foreground that will throw up the important part of the subject, and this can often be arranged artificially, especially towards the evening when the sun is low down, and an obliging friend with a large newspaper is able to cast a deep shadow sufficient to cover the front of the subject. Unlike most methods of "wangling" there is no fear of producing the unnatural, as the position of the sun cannot be changed, and the result is only the outcome of any object that might have been just out of the picture, whilst the value of a dark foreground from the pictorial point of view often more than counterbalances the objection on the grounds of a "fake."

Many bold effects may be obtained against the light, providing an efficient lens hood is available, and long shadows coming towards the camera often help from the artistic standpoint, whilst evening, with golden light, striking sunsets, and long shadows must always be a boon to those who love to

*Harlech Castle.*

record the real beauties of nature, and here again a dark silhouette in the foreground helps to add boldness to the picture.

Many photographs taken in direct sunlight are not convincing chiefly because the photographer has been afraid to take full advantage of the contrast, and, out of the fear of not obtaining sufficient detail in the shadows, has over-exposed and usually under-developed the plate.

PLEASE MENTION "THE AMATEUR PHOTOGRAPHER" WHEN CORRESPONDING WITH ADVERTISERS.

# "Two Point Setting"

The Nettar "two-point setting" is a great facility for the amateur photographer when on holiday or touring. You place the index of the focussing scale on the red dot, and the diaphragm pointer to another red dot. Use 1/25th second, and all outdoor subjects such as landscapes and portraits will be well exposed and defined in any bright light during spring and summer. Moreover, this feature does away with focussing difficulties, since everything from 10 ft. to 12 ft. onwards is rendered perfectly sharp. The "two-point setting" is only one of the many refinements supplied with the Nettar.

The Nettar is 100 per cent self-erecting. No need to pull down the front. Press the opening button and the lens front comes out to the correct position for taking pictures. The Nettar is made in one size to take  $3\frac{1}{2} \times 2\frac{1}{2}$  in. pictures.

#### Nettar Prices:

Fitted with Nettar anastigmat f/6.3 and 3-speed Derval shutter .....	£3 : 15 : 0
Fitted with Nettar f/4.5 and Telma 3-speed shutter, with "take-yourself" delayed-action release.....	£5 : 10 : 0
Fitted with Nettar f/4.5 and Klio delayed-action release shutter, 1 to 1/175th sec.....	£6 : 15 : 0
Fitted with Nettar f/4.5 and Compur delayed-action release shutter, 1 to 1/250th sec.....	£7 : 5 : 0
Fitted with Zeiss Tessar f/4.5 and Compur delayed-action release shutter.....	£9 : 17 : 6

# NETTAR

Of course, the Nettar will take all standard makes of roll films. The picture size is  $3\frac{1}{2} \times 2\frac{1}{2}$  in., 8 exposures, but the perfection of the Nettar justifies the highest possible quality film obtainable, and for this reason we recommend the use of Zeiss Ikon film now supplied with either orthochromatic or panchromatic emulsions. The Zeiss Ikon Pernox is over-coated with a plain emulsion which prevents all scratches and blemishes. Speed 26° Scheiner, 16/10° DIN.

12-page folder free; 80-page catalogue for cost of postage, 3d.

# DUFAYCOLOR FILMS

By W. G. THOMPSON.

THE progress of photography in colour has been advanced a stage farther by the advent of Dufaycolor roll films and film packs, which have recently been placed on the market by the Ilford Co. Although this process is similar to the Agfa process (see "The A.P." of July 10th, 1935, p. 45), the colour transparencies being obtained by reversing the negatives, these films have the advantage of being both faster and cheaper. The speed is given as 300 H. & D., which is practically as fast as ordinary black-and-white orthochromatic film. Using this as a basis for timing exposures, the present writer has obtained results which are completely satisfactory both as regards transparency and colour rendering.

Fig. 1.

Fig. 2.

Fig. 3.

Diagrammatic representation of the Dufaycolor Process.

R, G and B represent the Red, Green and Blue lines respectively.

The cost of a  $2\frac{1}{4} \times 3\frac{1}{4}$  roll film is only 3s. 4d. for six exposures. If the amateur does not wish to develop the films himself, this size film is processed and mounted for 1s. 6d.

Moreover, additional copies can be obtained for 1s., and if desired monochrome negatives made from a colour film for 6d.

The way in which this process reproduces colour is explained in the accompanying figures. The film consists of a celluloid base on which is placed a regular mosaic of red, green and blue areas, of which there are about a million to the square inch. On top of this is placed the photographic emulsion, the film being exposed with this emulsion farthest from the lens, so that the light has first to pass through the coloured grains.

Suppose a red object is being photographed, then the red grains alone will transmit this light, so that on development the film is only blackened behind these

grains. (Fig. 1.) The film is then placed in an acidified permanganate solution which dissolves out the blackened portion. (Fig. 2.) Finally the film is re-developed in daylight, so that the parts of the emulsion which have not previously been affected are now blackened. (Fig. 3.) Thus this part of the film will appear red when viewed by white light.

The colours green and blue are reproduced in the same way, and they are only transmitted by the green and blue squares respectively. Any other colour will be partly transmitted by one or more of these so-called primary colours. Thus yellow light is transmitted by both green

Fig. 4.

Diagram of a small part of a Dufaycolor film. R, G and B represent the Red, Green and Blue lines.

and red, and when the final transparency is viewed in white light these bright green and red squares in close proximity cause the sensation of yellow. Orange light is transmitted by the red and to a smaller extent by the green; and so on for other colours.

As the detailed working instructions are enclosed with the films, it is sufficient to mention that the processing is so simple that it is quite easy to take a photograph and have a transparency ready within an hour, without using any special apparatus, but in the first instance, at any rate, it is advisable to have the processing carried out by the Ilford special staff.

The ease with which high-quality results can be obtained is no doubt largely due to the colour-screen. It is probable that this screen (Fig. 4) is manufactured somewhat on the following lines. The celluloid base is first coated with a layer of collodion dyed green, and then a machine prints a series of equally-spaced parallel lines on the top of this. After drying, a bleaching bath washes out the green dye except where it is protected by the printing ink. A second bath dyes these spaces blue. The printing ink is now removed by a solvent, leaving the green and blue lines. Red lines are now placed at right angles to these by a similar process, and finally the light-sensitive emulsion is coated. This sounds fairly simple, but a little thought will show that the merely mechanical problem was one of extreme difficulty.

# A Camera

By A. CHAUNCEY.

*Patience.*

THERE are few more delightful places to linger than a cornfield at harvest-time, and the amateur will find a multitude of pictures there awaiting his camera.

A whole series might be made illustrating the harvest, beginning perhaps with a picture of the binder standing in a corner of the field. A low shot should be taken here, to secure the arms against the sky. Then there will be the arrival of the horses; their harnessing, and such activities as fitting the new bolt of twine on to the reaper.

It takes time to reap a field of any size, and the photographer will have ample opportunity of watching the proceedings before exposing a film. Walking about he will view the action from every angle, being

sure to select the backgrounds with care, so that unsightly telegraph poles and sheds are avoided whenever possible.

There comes a time in the reaping of a field when the three stages of the harvest may be shown on one plate. A sweep of the field is still uncut, and the corn stands ripe and rippling in the breeze. Secondly the reaper will be seen at work, and the corn will lie in bundles as it was tossed out by the binder. And thirdly, farther away, the corn will probably be shocked.

Activity in a cornfield generally is slow. When the reaper turns a corner there is a

*Up the Hill.*

*Fitting a new Bolt.*

moment when it is scarcely moving. A variety of angles should be tried when exposing. Horses look well when photographed from a low position with their heads against the sky. If there are any clouds in the sky they will lend added beauty to the picture, and to capture them a filter should be used. The light is generally strong enough to stand this without having to increase the exposure unduly.

Close-up views also lend variety

# in the Cornfields

to the series: the horses, for instance, with flies crawling on their noses, or the farmer himself, perhaps taking some well-earned refreshment.

In some districts certain ceremonies connected with the harvest survive. These are well worth photographing if met with, for many of them are disappearing, and the records may in time become interesting, if not valuable.

It may be asked what kind of

*The Reaper and Binder.*

*Stacking the Shocks.*

camera is the best for this particular class of work; but as in so many cases, there is no actual "best" about it. No doubt a reflex camera is an advantage. It shows the exact amount of subject included, and helps with exact focussing, especially for more or less close-up subjects.

But even a very simple camera will answer the purpose if its owner knows how to handle it, and, as has been said, there is seldom any need for exposures of more than the familiar  $1/25$ th of a second, which the simplest shutters give.

If ordinary roll film is used its orthochromatic qualities are a distinct gain, especially if a light yellow filter is used, as yellows are in strong evidence in the cornfields. If the photographer is accustomed to

panchromatic material, all the better. The plate user will find the non-filter, or anti-screen variety particularly appropriate provided he guards carefully against under-exposure.

The choice of the printing medium also requires careful consideration, and it will often be found that chloro-bromide, or toned bromide on cream base, provides the solution of the problem.

*By the Sea.*

# Letters to the Editor

*The Editor is not responsible for the opinions of his correspondents.*

## EXPOSURE METERS.

SIR,—The correspondence under this heading, initiated by Mr. Irwin, has interested me considerably, as it seems curious that it has required so many heads to solve a most simple problem.

Assuming, as most photographers do, the broad facts that  $f/6.3$  requires twice the exposure of  $f/4.5$ , and that a  $3\times$  filter requires three times the exposure as compared to a naked lens, the comparison of the two cases under discussion is easily arrived at by placing them in tabulated form, and by bringing the "filter case" to the same denominations of stop and filter as the "non-filter case," or vice versa, the result being identical in each case. Suppose we bring the filter case to the lever of the non-filter case, as under:

	Exposure.	Stop $f/$	Filter.
Filter case	$\frac{1}{200}$	4.5	$3\times$
	$=\frac{1}{100}$	6.3	$3\times$
	$=\frac{1}{300}$	6.3	—
Non-filter case	$\frac{1}{40}$	6.3	—

Having been brought to the same light-passing conditions, it is clear that it is a simple comparison between  $\frac{1}{300}$ th of a second and  $\frac{1}{40}$ th of a second, which is that the latter is *exactly seven and a half times* longer than the former.

I have often used this method of tabulating data, when an alteration in conditions is required, and by making the change *factor by factor*, it is almost impossible to go wrong, and I can recommend it to all my fellow readers.—Yours, etc.,

H. B. COLBOURNE.

## EXPOSURES FOR FILMS.

SIR,—The letter in this week's *Amateur Photographer* about the packing and price of films brought by your correspondent in Germany prompts me to write in agreement with the views therein set forth.

Your correspondent no doubt refers to the "Schleussner Tempo" film, which in common with other forms of "chrome" film is now sold in Germany for Mk. 1 for the  $6\times 9$  cm. popular size.

The letter prompts me further to express the hope that the price of films will forthwith be reduced as has been done in Germany. The Agfa concern, I think, took the lead in reducing the  $6\times 9$  cm. price to Mk. 1 and Mk. 1.20 for pan. films respectively. Further, the V.P. size film of the "chrome" variety can be bought in Germany for 90 pfennigs. It has always struck me that it is somewhat strange that one should have to pay as much for the smaller film as for the larger in this country.—Yours, etc.,

E. F. FLANDERS.

## "PHOTOGRAPHY MADE EASY."

SIR,—I notice in "The A.P." you are continually recommending "Photography Made Easy" as a beginners' book. May I also praise this extremely useful volume?

When I first started photography about two years ago I obtained the book, having noticed it was always being recommended in "The A.P.," and thereby benefited myself.

While it is only within the past year that I have become my own D. & P. and enlarging firm, since coming to Singapore, in fact, the excellent advice given on all subjects in the book has been my guide. I still consider myself nothing but a beginner, but without the help of that volume I should never have got beyond the button-pressing stage. "The A.P.," of course, is the natural complement to the book.—Yours, etc.,

F. J. MOTH.

## COLOUR FILMS.

SIR,—Apropos of Mr. Clark's article and Miss Tanner's letter and of many other letters you have published the last few years, why cannot the film makers mark the backing-paper with a continuous row of dots between the numbers, or, still better, with the first eight or ten letters of the alphabet? We should then know exactly where we were on the film. Using a Rollex slide, I have to expose on the first of the dots, and cannot use any Kodak films because they have no dots before the first number; nor can I use a half-size mask for narrow-angle pictures unless I re-spool the film previously on to a properly marked backing-paper.—Yours, etc., B. WRIGHT.

# A Distilled Water Dodge

SOME photographic formulæ, particularly those containing silver nitrate, insist upon the use of distilled water instead of tap water. Now, distilled water, despite its commonplace nature, is not a commodity which occurs in every household, or in every photographic work-room or laboratory, for that matter. The obtaining of distilled water in considerable quantities necessitates the employment of distilling apparatus of one type or another. Thus, the photographic amateur who comes across a formula which lays down the necessity of distilled water being used either "chances it" and proceeds to disregard that requirement (usually to the detriment of the work in hand) or else abandons the projected task altogether.

Distilled water, however, can be obtained without much difficulty in any household. All one needs to obtain a few ounces of this liquid is a convenient gas or electric stove—an ordinary fire will do at a push—a cold water container and a vessel for collecting the distilled water.

The illustration shows a handy arrangement for obtaining small amounts of distilled water. Water is boiled within the kettle and the issuing jet of steam is allowed to impinge upon the side of a suitably suspended can containing cold water. The can acts as a condenser of the steam and distilled water drops from its sides into the collecting vessel below.

An improvised "still" of this description has a working capacity of about one ounce of distilled water every three

minutes. Great care should be taken to ensure that the sides of the can, and also the interior of the receiving vessel, are perfectly clean so that there will be no danger of the distilled water picking up impurities from these sources.

## THIS HOLIDAY PHOTOGRAPHER SAYS—

**"TRUST WESTON  
—TO GET IT RIGHT"**

Any photographic  
apparatus taken  
in part exchange.

## WHEN YOU GO ON HOLIDAY

to the coast, cruising or abroad you are taking photographs under conditions which are entirely strange to you. The light is different and difficult. Yet this is the time above all others when you want to be sure that every photograph you take is a success. You can only be certain by letting the Weston Exposure Meter measure the exposure for the scenes with scientific accuracy and certainty. This it does in an instant and tells you the correct shutter speed and lens aperture for every shot. Direct sunlight cannot damage it—its sensitivity and efficiency are permanent. Once you've bought your Weston you are certain of successful photographs always—there are no renewals—no cost of upkeep—Weston lasts a lifetime.

**PRICE REDUCTION.** The Weston Universal Exposure Meter, for "still" and ciné cameras, now only £6/15 cash, or on easy payments, 15/9 monthly.

# GET IT AT "THE WESTMINSTER"

## YOU CANNOT DO BETTER

### THE NEW ROLLEICORD

F/3.8 Zeiss Triotar anas., Compur shutter, speeds 1 to 1/300th sec., T. and B. **£12:15:0**

Nine monthly payments of 29/9.

The new Rolleicord takes 12 pictures on standard 3½ x 2½ roll films, and is also adapted to take the Rolleiflex plate back and other Rolleiflex accessories, excluding the cine film attachment and angle mirror.

### THE DEKKO CINÉ CAMERA

for 9.5-mm. films.

British Made.

20-mm. f/3.5 Dallmeyer anastigmat (fixed focus), interchangeable screw-in lens mount. Variable speeds, half to normal and slow motion. 64 pictures per second, single - picture device, spring drive motor, taking through full 30 ft. of film at one winding, telescope type finder, built inside the camera, body of special wear-resisting bakelite. All outside fittings and film gate chromium plated. **£6:6:0**

Nine monthly payments of 14/9.

F/2.5 Taylor-Hobson anastigmat, fixed focus. **£6:16:0**

Nine monthly payments of 18/-.

1-in. f/1.9 Dallmeyer, micro-meter, focus. **£9:18:6**

Nine monthly payments of 23/2.

### AGFA SPEEDEX

IMPROVED MODEL.

TAKES STANDARD V.P. ROLL FILMS.

Fitted f/3.9 Solinar anastigmat, in Compur shutter, speeds 1 to 1/300th sec., T. and B., self-erecting front, optical direct-vision finder **£5:5:0**

Nine monthly payments of 12/3.

3½ x 2½, f/4.5 Agfa Solinar anastigmat, delayed-action Compur shutter, speeds 1 to 1/250th sec., T. and B. **£7:7:0**

Nine monthly payments of 17/2.

### THE NEW VOIGTLANDER BESSA

Takes 8 pictures 3½ x 2½ or 16 pictures 2½ x 1½ on standard 3½ x 2½ roll films, 620 or 120 size.

New design base-board which ensures perfect rigidity. Unique trigger release fitted under the base-board. Supplied in 8 models.

PRICES:

F/3.5 Voigtar anastigmat, Pronto 3-speed shutter. **£3:12:6**

F/4.5 Voigtar anastigmat, Pronto delayed-action 3-speed shutter. **£5:7:6**

F/4.5 Voigtar anastigmat, delayed-action Compur shutter, speeds 1 to 1/250th sec., T. and B. **£7:5:0**

Nine monthly payments of 16/11.

## EVERYTHING LEICA

THE BEST BARGAIN OF THE YEAR.

### A BRAND NEW ZEISS IKON IKONTA

AT A FIVE POUND REDUCTION.

Six pictures 3 x 2 in. for tenpence.

F/4.5 Zeiss Tessar anastigmat, ring control Compur shutter, speeds 1 to 1/300th sec., T. and B. Self-erecting front. Brilliant reversible and direct-vision finders. Leather bellows. All-metal body. Leather case. Absolutely brand new, complete in maker's box with instruction book and wire release.

Special Price **£5:7:6**

Solid leather case, 5/6 each.

Nine monthly payments of 12/7.

### A SPECIAL OFFER of 3¼ x 2¼

### KORELLE ROLL-FILM CAMERAS

GUARANTEED NEW.

F/4.5 Radionar anastigmat, delayed-action Compur shutter, speeds 1 to 1/250th sec., T. and B. Self-erecting front, lens focussing movement 3½ ft. to infinity. Optical direct-vision finder. Very neat and compact. Present-day value £9 15s. 6d.

Special Price **£5:18:6**

Nine monthly payments of 13/10.

### The 'VICTORIA' IMPROVED MODEL.

Takes 16 exposures on 2½ x 3½ roll film

Body constructed of a re-enforced composition (in black or brown). Opens automatically to infinity. Focussing adjustment for near objects. Direct optical finder. Film kept in exact register by special pressure plate.

F/2.9 MEYER TRIOLPLAN ANASTIGMAT, COMPUR SHUTTER, 1 to 1/250th SEC. T. AND B. **£6:19:0**

Nine monthly payments of 16/3.

SENT ON SEVEN DAYS' APPROVAL AGAINST FULL CASH DEPOSIT. Liberal Exchange Allowances. Hire-purchase Terms.

## The WESTMINSTER PHOTOGRAPHIC EXCHANGE, LTD.

111, OXFORD STREET, 119, VICTORIA STREET, GERRARD 1432. W.1 VICTORIA 0669. S.W.1 62, PICCADILLY, W.1 24, CHARING X ROAD, REGent 1360. TEMple Bar 7165. W.C.2

Appointed an Associate of the Institute

of Amateur Cinematographers, Ltd.

### THE NEW MODEL IIIa LEICA

Shutter Speeds 1 to 1/1,000th sec.

The Precision Camera.

F/2 Summar, automatic focussing, interchangeable lens mount, all chromium plated **£43:0:0**

Nine monthly payments of 100/6.

### THE NEW REFLEX-KORELLE

Self-capping focal-plane shutter, speeds 1/10th to 1/1,000th sec.

F/3.5 Schneider Radionar anastigmat, double exposures an impossibility, the lever shutter being coupled with the film-wind. Interchangeable lens mount. Stops and distance scales are read from above. Collapsible frame finder for taking pictures at the eye-level. All metal, leather-covered body. Takes 12 pictures 2½ x 2½ on standard 3½ x 2½ roll film, complete in leather **£10:10:0**

Nine monthly payments of 24/6.

### THE FOTH-DERBY FOCAL-PLANE AN IDEAL SPORTS CAMERA.

Takes 16 pictures on V.P. film.

F/3.5 Foth anastigmat, self-capping focal-plane shutter, with delayed-action device, speeds 1/25th to 1/500th sec. and B. Very compact **£5:5:0**

Nine monthly payments of 12/3.

### THE NEW ELECTRIC BEWI

AUTOMATIC EXPOSURE METER WITH COMBINED OPTICAL METER.

**£4:15:0**

Nine monthly payments of 11/1.

Slips in the waist-coat pocket. Quick and easy to manipulate.

# how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCXCV.

Dr.  
I. MAGDI.

From information communicated to our Special Representative.

"THE desire to draw and to make pictures has always been with me, but having taken up a profession which leaves very little leisure to its members the fulfilment of this desire only came when I discovered what a splendid instrument for artistic expression the camera can be.

"My favourite camera is a Rolleiflex 6×6 with f/3.5 Tessar.

For convenience of operation and certainty of results this type of camera is hard to beat. I occasionally use a miniature camera fitted with a distance meter, while for indoor subjects I use a 9×12 double extension plate camera.

"As to negative material I use Kodak Panchromatic film almost exclusively. I develop with Tabloid Rytol by the time and temperature method in total darkness.

"By sticking to the same material and the same developer I have acquired some measure of control over my results. I aim at a fairly plucky negative, thin but full of detail. With this object in view I give a moderately generous exposure and use a dilute developer, slightly shortening the development time. When washing is complete the film is carefully wiped with a moist piece of soft cotton-wool and is then hung up to dry slowly overnight.

"From my negatives I make contact prints quickly, and from the promising ones enlargements of the whole or the part are made on bromide paper, and developed in Johnson's Amidol or M.Q.

"Any necessary spotting is done after mounting with pencil or water colours, using a thin, almost dry brush. I do not hesitate to use local shading during enlarging where this is considered desirable, and I have in a few cases printed in some clouds when the pictorial merits of a negative were lacking in this particular.

"The size, surface and contrast of the bromide paper are chosen to suit the particular negative or negatives to be used. For my best pictures I prefer the 10×12 inch size and a not-too-dull surface, smooth where detail is required or rough where broad effects are in mind.

"The choice of subject is a matter of personal tastes, environment and circumstances. Where a subject appeals to me I find it a useful rule to make two or more exposures.

"Ideals in pictorial photography, as in most other worldly things, are difficult to attain. But I believe that they lie in a higher conception and interpretation of the beauty of things, and in a fuller and wider utilisation of the effects of light and shadow, and not in the use of the camera as a mere instrument of record or as an imitator of other graphic arts."

(A further example of Dr. Magdi's work is reproduced on one of the centre Art pages.)

Toil.

Dr. I. Magdi.

# Pictorial Analysis

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"THE FOUNTAIN," by K. S. Stone.

ATTRACTIVE as this group is and well as it has been caught, it does create a query concerning the reason for its placing so much towards the left-hand side, particularly as the right contains little that could not be dispensed with to advantage, and, by an addition to the left, the existing sense of restriction could have been avoided.

There is the possibility, of course, that the present boundary was dictated by the necessity for excluding an undesirable feature, and, in that event, there would have been no alternative as far as the left-hand side was concerned, but, even so, it is difficult to see why a considerable portion of the right-hand side was not removed in order to prevent the feeling of the group being pushed and confined in the left-hand top corner.

It is true that the scale of the figures would be appreciably increased, but it would not be to such an extent that they were unduly large for the picture space, nor, by the sacrifice of a considerable proportion of the fountain, need it be thought that the picture would lose any of its literary content. Rather the reverse, for, if the print were trimmed in accordance with the dotted lines of the sketch at right and base, the figures would gain in significance on account of their greater proportionate size, and that part of the fountain included would be relegated to its proper sphere as an element in the setting.

The figure (1) would then be forcefully placed, as she should be, having regard to the fact that she is the chief of the three. Her body would fall upon one of the intersections formed by horizontal and vertical divisions of thirds and could not be more suitably disposed. This, in conjunction with the dominance suggested by her height in the picture space, would ensure her principality, and, with the figure (2) as the secondary element and as a supporting accent combined

with the other (3) as the third item and connecting link, an excellent group would be formed, which, in the revised arrangement, is admirably placed in relation to the pictorial boundaries.

The only drawback, as far as can be seen, is that, owing to the need for the removal of a portion at the

from the right-hand side and the present base line could be retained.

Then, while the scale of the figures would be smaller, their disposition in the picture space would be relatively the same as in the alternative arrangement recommended, and, from the compositional standpoint, would be equally acceptable.

In other respects, the work is highly attractive. It displays a fine feeling of luminosity, a great deal of which it owes to the placing of the topmost figure against the light of the sky at its strongest, while the darkening towards the top, with the lighter portion below, is also a factor of some moment. The brilliance with which the figures are outlined, taken in conjunction with the great depth of tone where they are in shadow, conveys an excellent impression of sunshine, and, altogether, the whole effect is delightful.

From the technical point of view, the treatment is equally good. The subject is one of greater than normal contrast, for one thing, and, for another, a nice judgment is needed in estimating the exposure in view of the necessity for avoiding too much movement in the water and at the same time allowing enough to record the modulations in the darker portions.

That both aspects have had due consideration is evident from the picture. The exposure has not been so short as to render the water in such

a way that it seems frozen into immobility, nor so long that its form is lost and its outlines blurred beyond recognition. A close scrutiny reveals that, even in the darks towards the base, there are distinctions between tone and tone adequate enough to convey a sense of modelling and shape.

In the lights, too, there are degrees of brightnesses and those little brilliant touches of lights within lights lend a vivacity and virility to the presentment which appreciably enhances its pictorial attraction. "MENTOR."

base to avoid too long a shape, the dark there is lost and the composition does not seem quite so stable in consequence.

Unfortunately, there is no alternative—although the defect could be minimised by darkening the tone generally at the base by local extra printing—unless it is possible to add something to the left. If only another inch could be added, it would mean that, instead of trimming to the dotted line, only one and a half inches of the original need be removed

THE FOUNTAIN.

# PICTURES by Novices

*SOME CRITICAL COMMENTS on  
the Beginners' prints reproduced on the opposite page*

"SUNSHINE ON ROCKS," by B. E. Woods—No. 4 of the prints reproduced on the opposite page—has the germ of an idea that might be considered pictorial, for the sunshine is evident, and the arrangement of the subject, with its excellent lines, makes a well-designed composition.

## **Sunshine as a Motive.**

It is the latter, of course, that enables the sunshine to tell so effectively. The technique, also, is partly responsible, inasmuch as neither of the other qualities could be adequately expressed without it, but it is the placing of the splash of sunshine in the picture space; its isolation by the surrounding shadow tone; and the arrangement of the lines of shore, waves, and cliffs so that they seem to lead up to it that make it so effective.

As far as the placing is concerned, the light on the top of the cliff stretches from the left-hand side to just about the centre. That is to say, its centre is well away from the edge and sufficiently in the picture to acquire strength of position. That strength is emphasised by the way the lines appear to indicate it, as the direction they assume is from the other boundaries towards it.

Because it is surrounded by darker tone, its value is further stressed, and, on account of all these factors working together, not only is the feeling of sunshine well brought forward, but it is made to transcend what interest the subject might possess from the topographical point of view.

It is this that gives it an artistic appeal, and though the feeling might be heightened if there were a shade more tone in the sky—such as would accord with the visual impression—it makes a very good effort in its class.

## **Tone Values and Skies.**

The greater sense of harmony and greater realism in representation that come with a greater depth of tone in the sky are evident in No. 7, "Westminster Sunset," by J. E. Vaughan.

The subject, admittedly, is one that has often been done before, but, in essentials, it is sound, and, as far as the sky is concerned, it does show a not inconsiderable advantage over

No. 4. The same depth, of course, would not be necessary in "Sunshine on Rocks" as in No. 7, for the time of day is different, and, naturally, a lighter sky would be appropriate in the former, but, for all that, it would gain, pictorially and realistically, if its tone were deeper.

With the main attraction in the sky, No. 7 seems to be too equally divided. The horizon is too near the centre of the print, and, with half an inch trimmed from the base, not only would the sky derive that greater emphasis which it should possess, but the proportions between landscape and sky would be more in accordance with their respective attractions.

In the case of No. 5, "Evening," by Mrs. J. M. Parsons, the sky has not the same restful feeling, the mood being more inclined towards storm, but the sky, again, is the chief interest, and, consequently, should be allotted the greater proportion of the picture space.

## **Picture Proportions.**

All that foreground is so much waste, and, were the print trimmed so that the base would come just below the stretch of dark towards the centre, the sky would attain the preponderance that is its due, and the pictorial proportions would also be improved.

The cloud is a bit heavy, and, without casting any doubt upon the truth of the rendering, it may be remarked that the effect would be equally striking if the form were retained and the depth somewhat reduced. The remedy, however, lies in the choice of subject material, for, short of the exercise of a considerable amount of control, nothing that would be really effective can be done now that the negative is made.

"Leamington Spa" (No. 2), by A. W. Witham, could, like No. 4, do with rather a greater depth both in the sky and in the water of the foreground, but, in this instance, it would be possible to attain the needed additional tone by carrying printing a little farther. A greater depth throughout would be beneficial and the darks could stand it without getting choked up.

The sky is no deeper in "Nature's

Stage" (No. 1), by Leonard Matthews, but, being surrounded entirely, it does not seem to matter.

## **Restraint and Effect.**

No. 3, "In Old St. Ives," by Harry Dunks, falls into a different category. It is a street scene, and the sky is an element of but little significance. It might almost be preferable if it were excluded altogether, for it does introduce something of a note of competition, which the subject would be better without, and does not seem to be really needed.

The suggestion of sunshine would gain, at all events, and that is a consideration that should be taken into account. In other respects, the print is characterised by its excellent workmanship and the restraint with which the extremes of tone are employed.

Most of the print is in half-tone, and both strong lights and darks of any considerable mass and depth are lacking. Apart from the sky, the brightest note is the top of the lamp on the right, and, as this comes against a heavier tone, it forms a point upon which the interest centres. Nevertheless, it has a modicum of tone, and, despite the lack of extremes, there is no loss of vigour, nor does the work seem inclined to weakness.

## **Brightness and Strength.**

No. 7, on account of its mood, is much heavier in its general tone, but it is no stronger in effect than No. 3, for, in both, the tones are decisive and appropriate to the way in which the subjects are lit.

There are few really deep notes, again, in No. 6, "Old Farm," by Dr. G. S. Miller; the lights are not without gradation, and, generally, the major proportion is in half-tone. The workmanship is equally good, but the wisdom of allowing the strongest of the lights to be placed at the right-hand edge is doubtful, and either it should be removed by trimming or the line of sight should have been altered so that it came more in the picture, leaving some more half-tone between it and the edge. This might mean the loss of some of the trees on the right, but, if desired, they might be retained by the adoption of a slightly more distant viewpoint.

"MENTOR."

# With the Beginners

## NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

### A SIMPLE CAMERA BY THE SEA.—II.

I HOPE the abrupt manner in which I broke off last week was a sufficient indication that I had not finished what I meant to say about a camera by the sea—or rather at Southend, which is by the sea one minute, and a mile away the next.

It is a somewhat mysterious thing to me that people on holiday by the sea (or anywhere else) with a camera, make so many exposures on each other. I can understand it when figures are taken in beautiful or interesting surroundings, which serve as a pleasant reminder of a visit to the spot; but not when the setting is less suitable than can be found in the house or garden at home. It seems to me that it would be more sensible to make a few shots characteristic of the place itself, which often means of the people there as well.

The photograph of the Crow Stone, which I showed last week, would certainly interest people with brains much more

Fig. 1.

than a snapshot of my companion, with a background of iron railings or crowded sands.

Better, too, are photographs of kiddies at play, which are not portraits, but just any kiddies. Some there are who prefer bathing belles—so-called—of the very sight of whom I am deadly tired. I prefer the unselfconscious youngsters. When a group like those in Fig. 1 is taken the result is a failure when bits and pieces of other mortals are included. The group must be isolated, and complete in itself, and this is not always easy to achieve.

In this case I deliberately included the bits and pieces to show how not to do it. Then I meant to show the better way, and with this intention took Fig. 2. I edged up as unostentatiously as I could to the three youngsters in the boat, pretending all the time to be interested in something in another direction. Out of the tail of my eye I estimated

Fig. 2.

the distance and the right line of fire, set the scale, stop and shutter, and when I thought everything was as it should be, swung round and fired.

But, alas, in that very fraction of a second, two of the three—those whose faces had been towards me—dived forward to something in the bottom of the boat, and my shot missed its mark. That, however, was mere bad luck, and my method of procedure was the right one. Try it, and you will find how well it works as a rule.

I noticed that a characteristic feature of this part of the shore was boating of weird kinds. I had already had a shot at a pool with motor boats, apparently fitted with four-stroke engines that had a habit of missing at least three strokes out of four. But here were craft of another kind—several other kinds. Some had two bows, so that

Fig. 3.

they would go either way ; and others two sterns, so that they would go neither. So I took a few shots, of which Fig. 3 is a sample, to give an idea of the fun. The main idea seemed to be to discover the greatest number of vessels that could be involved in one and the same complicated collision. Have no ciné amateurs noticed the possibilities ?

Further emphasis was given to the boats by showing a few in the foreground of Fig. 4, which also suggests the character of the place at low tide. From the few negatives I made on this occasion, and others secured at intervals over a good many years, I could construct a pretty complete panorama of the place from the crowded Kursaal area in the east to the cockle-sheds at Leigh in the west—all the fun of the fair, the pier with its fishers and steamers, pleasure yachts and fishing bawleys, gardens, bowling greens, boating and swimming pools ; everything but the modern illuminations, which are really marvellous, although I am old-fashioned enough to prefer the sunsets.

One other thing I have missed, the old church perched on the ridge at Leigh, built (in spite of a certain commandment) of stones from the ruins of Hadleigh Castle, and with a boat's mast for the flagstaff on the tower. This I ought to have included, and by way of fearsome contrast some of the buildings that have sprung up near it.

And all these things, and more, the photographer, however simple his camera, ought to harvest when he goes down to the sea. Bathing belles, if you like, and even

Fig. 4.

snaps of your friends ; but do not neglect the other things. Make a pictorial record of the place, and show its character.

As I said, I am showing no "pictures." You will find them in large numbers in other articles that appear constantly in this paper. Learn from them. Learn to make them yourself. It will not be long before you fly at higher game than some of the all-too-usual seaside snaps. W. L. F. W.

## ICE-CREAM PHOTOGRAPHY By ABRAHAM LEE.

SOMETIMES by choosing subjects in particular it is possible to produce noteworthy photographs. Indeed, one can often strike new trails in camera byways by concentrating upon particular subjects. Ice-cream and the camera are strange companions, yet they work happily together, especially at holiday times. The big lesson is the subject interest that the commonplace ice-cream creates, whatever the persons or animals concerned.

Another lesson to be learnt, as with most particular subjects, is that one can be over-hasty in the excitement of snapping subjects that are so thrilling. It is a doubly hard lesson to learn, since it is not often possible to try again after we have discovered errors of hasty and nervous exposure. All the more reason to make sure that the film *was* turned round, that the shutter and iris *were* correctly set. These are easy subjects, but it is easy, too, to half obscure the lens with the hand, or to misfire the shutter by accident and make those double exposures. I recommend a direct-vision finder to remove half the usual camera errors and failures.

Ice-cream photography calls for the unposed picture, never more popular than it is to-day. We find here, however, the colourful action rather than the galloping action. Our subjects are doing something nice and enjoying themselves rather than exerting strenuous activities. If you yourself begin to analyse mentally the various opportunities with this subject as they come along you will discover that this is the essential charm to be interpreted in many holiday scenes and places.

I have bought many ices and taken many snapshots, and so fascinatingly new is this subject that I shall purchase lots more ices and lots more films. I have never found so easy a way to win a real picture in places where real pictures are made. Whether in camp, on the beach, or on board ship opportunities such as these abound. If not they can generally be made.

These subjects are, after all, just portrait snapshots with a difference, but I recommend that the next time you snap your pals you try an ice all round and see the difference.

*Warm and n'ice.*

# Picture Points

## for Beginners by RICARDO

### Watch the "Lines" when Arranging

WE have, previously in this series, seen the weak effect of allowing the contours of subjects to just touch each other instead of deliberately breaking into, or being completely separated from each other. Similarly, it is also weak composition when the contours lead into each other.

In the first of these two sketches, these faults occur in several places. The bottom edges of the plates just touch the edge of the tray as well as the left-hand side of the vase. But where the lines are leading into each other are shown on the right side

of the vase and the shadow from the tray and also on three sides of the tray. The top and left edges coincide with the print edges and the bottom edge coincides with the back of the table.

To show how these faults can be eliminated, a suggested rearrangement of the same subjects, with the same lighting, is shown in the second sketch. The general effect is to give a much stronger composition, mainly due to the different assembly, but partly due to the elimination of those weak contact points. As far as composition is concerned, these so-called "lines" are nothing but the "edges" of contrasting masses of light and shade, so

that it will be seen that the "line" of a shadow needs to be watched just as much as, say, the "line" or contour of a face.

### When Shadows are Distracting

BECAUSE, in the majority of prints, the interest is centred round the high-lights, the beginner does not attach enough importance to the darker tones. We know that the successful print is a combination of several factors—an interesting *motif*, pleasantly presented by a harmonious arrangement of light and shade, with each dependent on the other. Then when we stop to realise that it is the darker tones that surround and so provide the high-lights, we are

beginning to realise their importance in the whole scheme. When the lighting is under our control the shadows are under our control, too, and we can make them dark or light, or hard or diffused, just as we wish. In the two sketches here we can see the effect of badly placed lights causing awkward shadows.

In the left-hand sketch, the shadow could play a strong part in the picture, but because it is so hard it creates an irritating saw-like shape that is distracting. It should be soft and diffused and be subordinate to the figure instead of predominating.

Similarly, in the portrait on the right, we have another distracting shadow, which, apart from its unsuitability to a subject of this kind, is bordering on a caricature and so tends to ridicule the sitter.

### Relation and Proportions

IN judging the pictorial qualities of a print, one is quick to see anything that does not conform to accepted standards of proportion. For example, if an apple were shown to be the same size as, say, a melon, it would look unnatural and absurd, and we should reject it immediately, regardless of what other fine qualities the print might possess.

On this same basis, anything that shows a big contrast in masses also runs the risk of looking ridiculous, like the badly-arranged still-life group in the top sketch. Sometimes it is due to foreshortening caused by the camera being too near, such as is shown in the lower sketch.

If we examine the top sketch we realise that the absurd proportion between the two items is caused by the tall bowl as well as the contrasting masses of fruit. The remedy is obvious. A lower bowl containing less fruit alongside a small cluster of grapes (one always looks too solitary) will lend itself to a much more pleasing arrangement.

In the lower sketch, where the gloves appear to be three times the size of the hat, the fault is due to the distance between hat and gloves being too great to suit the distance between camera and gloves. The remedy is to place the hat alongside the gloves or else, should the arrangement have to stand, place the camera much farther away until the hat looks in better proportion to the gloves and stick.

If a focussing screen is fitted, the proportions can be compared before exposing, but if only the view-finder is used, the reflecting and the glass type of direct vision finders are better than the open wire finder for this purpose.

# CLIFF-TOP *Photography*

By DONALD G. SHELDON.

A GOOD deal of our British coastline consists of cliffs. Thanks to the existence of coastguard tracks, most of it is accessible to the public. The photographer who visits a cliff coast will find plenty of scope for his camera, but there are several points to be noted if successful results are to be obtained.

The magnificent spread of scenery viewed from cliff-tops is at once a temptation and a snare. It is hard to resist taking photograph after photograph of some wide panorama, only to be disappointed when we see how insignificant it appears in a print.

*A Cliff-side Family.*

We can avoid this disappointment by using our panorama as a background for some nearer object. This may be a tree, cottage, stile, animal, or human figure—anything which will form a resting-place for the eye and act as foil to the more delicately rendered distance. Owing to the presence of water-vapour there is always a suggestion of atmosphere; this helps to stress our nearer objects and so create the illusion of space and distance.

There is another reason for including a figure or other object of known size. We can only gain a true idea of the proportions of the cliffs when some such object is present for the purpose of compari-

*Silver Sheen.*

son. When it is lacking we have no means of knowing whether we are gazing on a huge mass or a table-top study!

Cliff-tops are ideal places for making cloud studies.

*Storm Approaching.*

Scarborough Bay by Moonlight.

For this reason it is wise to carry a colour filter, so that the tone of blue sky may be rendered dark enough to show up the white clouds. In addition to this, there will be a general improvement in the tones of grass, sand, and rock, which tend to be shown too dark. The im-

provement will be greatest when panchromatic materials are used, though the various "chrome" films come a good second in this respect.

It is often possible to secure good subjects by pointing the camera slightly downwards, omitting the sky altogether. An example of this

type is "Silver Sheen," where the glow from strongly-lit clouds was reflected in the wave pattern.

In many parts the cliffs form the home of numerous birds, and the possibility of securing photographs of them on the wing has lured many photographers into enormous wastage of film. Though their apparent speed does not seem great, yet it is difficult to get sharp pictures of them with shutter speeds slower than 1/200th of a second. At rest there is more chance, and the example shows the kind of thing which can be got without special apparatus if patience is exercised, and care is taken not to scare away the birds by sudden movement.

When there are cliffs near a seaside town, we may sometimes get unusual effects by using them as a perch for a night photograph. The picture of Scarborough Bay was taken by moonlight in 90 seconds at f/5.6 on an Ilford Hypersensitive Panchromatic plate. For subjects of this kind the plates should be backed, in order to minimise the spreading of the lights.

## The Week's Meetings

Wednesday, August 21st.

Dennistoun A.P.A. Dockland.  
Partick C.C. Print Criticism.  
Worthing C.C. Burpham.

Thursday, August 22nd.

Hammersmith H.H.P.S. Retouching. Miss D. Thorburn.  
N. Middlesex P.S. "The Lantern and Some Slides from the Permanent Collection."  
E. E. Bennett.

Saturday, August 24th.

Bradford P.S. Goat Stock, Harden.  
Dennistoun A.P.A. Kilsyth.  
Hackney P.S. Knockholt.  
Hammersmith H.H.P.S. P.L.A. Outing. Visit to the Docks.  
Ilford P.S. Chingford. Meet at Ilford Station, 2.30 p.m.  
Medway A.P.A. Surprise Ramble.  
Partick C.C. Tillietudlem.  
Sheffield P.S. Airport to Bakewell.  
Stafford P.S. Seven Springs.

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Sunday, August 25th.

Cripplegate P.S. Hedley and Mickleham.  
Harrogate P.S. Secret Motor Ramble.  
Singer C.C. Moffat.

Monday, August 26th.

Oldham E.P.S. Holiday Talks.  
Southampton C.C. Thiocarbamide. W. R. Kay.  
South London P.S. Lecture by W. J. Joughin.

Tuesday, August 27th.

Hackney P.S. Talks on Many Things.  
Nelson C.C. Slide-Making.

Wednesday, August 28th.

Rochdale P.S. Hints on Making Dark-room Appliances. H. H. Stansfield.  
Stockport P.S. Competition.

## Exhibitions and Competitions

### CURRENT AND FUTURE.

Notices of forthcoming exhibitions and competitions will be included here every week if particulars are sent by the responsible organisers.

*The Amateur Photographer* Monthly Competitions for Beginners, Intermediate and Advanced Workers. Entries, August 31. Rules in the issue of July 31.  
California Pacific International Exhibition, San Diego.—May 29–November 11. Particulars from Miss Ruth Kilbourne, Exhibition Headquarters, Balboa Park, San Diego, Cal., U.S.A.  
Paris International Salon.—October 5–20. Secretary, M. E. Cousin, 51, Rue de Clichy, Paris.  
Southern Counties Salon (organised by Camberwell C.C.).—August 11–31. Hon. Salon Secretary, W. Bertram, 45, St. Lawrence Road, Brixton, S.W.  
South African Salon (Johannesburg).—August 26–31. Hon. Secretary, Johannesburg Photographic Society, P.O. Box 7024, Johannesburg, South Africa.  
Amsterdam International Salon.—September 14–29. Further particulars from Focus, Ltd., Fotosalon, Bloemendaal, Holland.  
London Salon of Photography.—Entries, September 4; open, September 14–October 12. Further particulars from Secretary, London Salon, 5a, Pall Mall East, S.W.1.

R.P.S. Annual Exhibition.—September 14–October 12. Further particulars from Secretary, 35, Russell Square, W.C.1.

Irish Salon (to be held at Mansion House, Dublin).—Entries, September 14; open, November 2–9. Particulars from Hon. Secretary, Irish Salon of Photography, 18, Morehampton Road, Dublin.

Rotherham P.S. International Exhibition.—Entry forms due, September 23; prints, September 30; open, October 16–19. Hon. Exhibition Secretary, E. George Alderman, Ruardean, Newton Street, Rotherham, Yorks.

Indian International Salon (promoted by Camera Pictorialists of Bombay).—Entries, October 1; open, November 17–30. Hon. Salon Secretary, F. R. Ratnagar, Central Bank Building, Fort, Bombay, India.

G.W. Rly. "Camp Coach" Holiday Competition.—Prize, one week's holiday in camp coach during 1936 holiday season. Photographs should depict any aspect of camp coach holiday. Entries due,

October 31. Further particulars from Superintendent of the Line, G.W.R., Paddington Station, W.2.

Canadian International Salon, National Gallery of Canada, Ottawa.—November 6–21, and afterwards in other Canadian cities. Entries due, September 20. Entry forms and further particulars from Exhibition Secretary, Canadian International Salon, National Gallery of Canada, Ottawa, Canada.

Cape of Good Hope International Salon (under the auspices of Cape Town P.S.).—Entries due, November 19; open, January, 1936. Hon. Salon Secretary, Richard Dekenah, P.O. Box 2431, Cape Town, South Africa.

Leicester P.S. International Exhibition.—Entries, January 24, 1936; open, February 24–March 7, 1936. Exhibition Secretary, H. Foscutt, 19, Doncaster Road, Leicester.

The 40th Annual Exhibition of the South London P.S.—Open, February 15–March 14, 1936. Entries close, January 21. Further details and entry forms from Hon. Exhibition Secretary, H. S. Adams, 40, Stockwell Park Road, London, S.W.9.

# NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

**Dufaycolor Films.** The long promised Dufaycolor films are now on the market and obtainable from all photographic dealers. For roll films and film packs no filters are required, the films being exposed exactly in the same way as ordinary ones. The results with Dufaycolor show the subjects in their natural colours, and these are extremely well rendered, some specimens before us as we write being delightful pictures with a full range of colour. Exposures are much shorter than with any previous colour process. Seashore subjects, for instance, at  $f/4$  require as little as  $1/100$ th of a second during the present month at midday. Although directions for development are enclosed with the films, it is advised that they be returned to Messrs. Ilford Ltd., via the dealer from whom they were purchased, for processing. After some specimens are thus produced, so that users may see the type of result that Dufaycolor should give in expert hands, amateurs may try the effect of home development. Prices for 6-exposure roll films are:  $3\frac{1}{2} \times 2\frac{1}{4}$  3s. 4d., processing 1s. 6d.;  $4\frac{1}{4} \times 2\frac{1}{2}$  4s. 4d., processing 1s. 9d. For 8-exposure film packs, the prices are:  $1\frac{1}{2} \times 2\frac{3}{8}$  6s., processing 3s. 9d.;  $3\frac{1}{4} \times 2\frac{1}{2}$  8s., processing 3s. 9d.;  $4\frac{1}{4} \times 3\frac{1}{4}$  12s. 6d., processing 5s. Copies in colour will be supplied at the following prices:  $2\frac{3}{8} \times 1\frac{1}{2}$  and  $3\frac{1}{4} \times 2\frac{1}{4}$  1s. each exposure;  $4\frac{1}{4} \times 2\frac{1}{2}$  and  $4\frac{1}{4} \times 3\frac{1}{4}$  1s. 4d. each exposure.

Dufaycolor is also obtainable in 16-mm. ciné film, price 21s. for 50 ft. and 40s. for 100 ft., including processing. For ciné film it is necessary to employ a filter in the lens, but as one is supplied free with each carton, this will cause no

trouble. Full particulars may be obtained from any dealer or, if *The Amateur Photographer* is mentioned, post free from Messrs. Ilford Ltd., Ilford, London.

**The Camberwell C.C.** is holding its second international exhibition in the lounge of the Astoria Theatre, Brixton. It will be open daily from 10 a.m. till 11 p.m. until August 31st.

**The Coronet Camera Co.** (310, Summer Lane, Birmingham) are offering prizes for  $3\frac{1}{2} \times 2\frac{1}{4}$  enlargements from negatives taken with their Midget camera. Cash prizes of 25, 10 and 5 guineas are offered, with ten consolation prizes of one guinea each. The conditions, which are very simple, can be obtained from any dealer.

This year the Scottish Amateur Film Festival is being organised by a special Amateur Cinematograph Panel of which the hon. sec. is Mr. Ian S. Ross, 80, Buchanan Street, Glasgow, C.1. The judge on this occasion will be Mr. John Grierson, and entries are invited for the following four classes: (A) Story films, open to clubs in Great Britain; (B) Interest films, open to clubs in Great Britain; (C) Films of any description, open to individuals resident in Scotland, and (D) Sound films (sound-on-film only) of any description, open to clubs and individuals in Great Britain. A prize of £10 is offered in each class, and the Victor Saville Trophy will be awarded to the most outstanding film shown. Entry forms are available from ciné clubs, photographic dealers, or direct from Mr. Ross, as above.

In referring to the Vauxhall de Luxe camera we quoted the price of the leather case as 7s. 6d.; this should be 6s. 6d. We may add that another case is also available in pouch form with zipp fastening, at 4s. 6d.

**"Profitable Photography with the Miniature Camera"** is a book written by Edwin C. Buxbaum, and published by The Box Tree Press, of Milwaukee, U.S.A. It is on sale in this country, price 5s., from Messrs. Sands Hunter and Co., 37, Bedford Street, Strand, W.C.2. Naturally, its 72 pages contain certain information of interest to the miniature camera user, but it is equally natural that a great deal is of no practical use, and even definitely misleading to photographers in this country. Materials, markets for prints, and so on, are exclusively American; so are the financial information, and copyright procedure. We consider, too, that much of the work described can be done far more conveniently and effectively with apparatus other than the miniature camera, which seems to have been brought into the business mainly on account of its undoubted popularity. At the same time there are many suggestions for new fields of work with small cameras.

A competition for photographs of trees has again been organised, and particulars can be obtained from The Men of the Trees, Competition Secretary, 10, Victoria Street, Westminster, S.W.1. Cash prizes, books and certificates will be awarded in three classes: Tree portraits and beautiful woodland studies; famous, historic and curious trees; woodland plantations and scenes illustrating forestry work. The closing day for entries is November 1st, and an exhibition of the best entries will be held during the month. The usual "tree" calendar will also be issued.

## A Competition specially for Novices

### SUBJECTS.

Prizes will be awarded for the best snapshots of family groups or single figures taken at home or on holiday, indoors or outdoors. The arrangement of the groups or the pose of the figures is left entirely to the discretion of the competitor.

The competition is open only to novices: those who have never won an award of any description in a photographic competition.

Entries are restricted to contact prints. The smallness of the prints, which may be mounted if necessary, will not affect their careful consideration in this competition.

### PRIZES.

The prizes will consist of supplies of roll film or of plates (if any winner happens to use a plate camera).

THE FIRST PRIZE WILL BE TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.

THE SECOND PRIZE WILL BE TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.

THE THIRD PRIZE WILL BE ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.

TWELVE PRIZES OF ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

The winners of these prizes will thus be encouraged to continue their photographic activities throughout the year with a supply of free film.

### RULES.

Each print must have affixed firmly to the back, a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor.

The latest date for receiving entries is September 7th, 1935. This will give new readers, who are novices, who intend entering this competition every opportunity of improving their work during the next few weeks by reading "The Amateur Photographer" every week and obtaining their competition prints during the summer holidays.

The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed as follows: The Editor, "The Amateur Photographer," Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices' Competition."

Further references to the competition will be made week by week, and hints given for the best treatment of groups and figures.

# Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

## Subjects for the Amateur Cinematographer

By S. E. L. MOIR.

Even the experienced cinematographer is sometimes at a loss for subjects, and the following hints, if thoughtfully considered, may be a guide and inspiration to him and to the beginner alike.

SUCCESS in amateur cinematography depends as much upon the selection of suitable subject matter as upon any mastery of the technique of shooting. That is why some of the older play-films—technically good—make their sponsors wonder why on earth they ever dabbled in such clumsy enterprises.

Not that the play-film cannot be good (Lebediev's film, "The Son of a Soldier," shows us how excellent it can be), but to result in anything like lasting satisfaction it must be carried through by a combination of experienced directors and other people well acquainted with the psychology of treatment.

Now, this is a combination to be encountered only on very rare occasions, and it is because he finds it difficult to secure such assistance that the ordinary enthusiast must look beyond the photo-play for his most successful achievements. In this connection, I was not a little pleased to see that W. L. F. W. gave it as his considered opinion that beginners should pay more attention to the cinematography of plotless scenes which contain the one essential of motion. This is very sound advice, and in following it the beginner can produce episodes of lasting beauty that will bear projection long after the "hero and heroine" nonsense has been howled off the screen.

### Making Progress.

Perhaps the greatest value of such advice lies in the fact that sooner or later the beginner will discover for himself that the simple scenes of his original essays can be treated in a manner that lends itself to definite achievement. He may, for example, discover that simple subjects form a ready basis for interest and news-reel films. He may decide to specialise for a time in one given subject; or he may seek to film a number of incidents current about the same time for inclusion in a "topical" film.

Working upon these lines, one of the most visionary amateurs of my acquaintance once made an interest film of "London Uniforms"—a highly specialised work, whilst another succeeded in making a really exciting film of his own garden.

The main thing in all such simple essays is to record *movement*. Shots of the uniformed dignitaries standing about in preening attitudes would not have made an edible film; yet when there is a pleasing flow of action from the long shots into the close-ups and again all through the film—well, the result is sufficiently important to connote a model for the best of us.

Next in order of importance after movement are *life* and *interest*. Movement will, of course, help to sustain

these, but no amount of action will compensate for a dull subject. News-reels, mainly on account of their everlasting similarity, are apt to appear "stale" even at the earliest showings; but the amateur can avoid this merely by keeping closer at home for his subjects. He can, for example, include a short sequence of the milkman delivering the morning supply (which, because few members of the family have ever witnessed that early-morning event, will prove far more attractive than any shot of the mayor officiating at the opening of a re-decorated picture theatre). And his subsequent shot of Mary bullying-off for her hockey team will shake his audiences to life after "Belisha beacons in Brentville" has got them

The high viewpoint is often more interesting to the cinematographer than to the "still" worker. If handled with care and discretion such subjects provide a welcome change.

nicely settled for a short spell of oblivion.

### Documentaries.

All of which is progress. But it is possible to go much farther—to venture into the land of the documentary. Now, not all people know what a film document, or a documentary, is. I find one or two writers treating in the most slighting fashion of this important phase of production work; and lest any of my practical readers be in doubt on the matter it had better be made quite clear that the documentary is not a "casual string of casual shots all bearing on the same subject."

It is true that many of the shots are indeed casually taken, but this is only because it was impossible to assume their existence at the time of planning the film. For all films of this character must be *planned*. There must be a well-thought-out beginning, a clever unfolding of the "story," with a stirring climax or dramatic issue somewhere near the end of the film.

The "London Markets" documentary, which was one of the films it was

decided to make at the Summer School of the I.F.M.A., is to be made on these lines—even to the extent that good shots unexpectedly cropping up will be used wherever possible in the final editing of the film.

### Editing.

It is not too much to say that simple subjects which lack the plot or narrative of the photo-play require the exercise of far greater skill in the editing stage. For here the intense power of the film is created by purposeful editing—which aims to express the moods or emotions of the film by the particular manner in which the photographed images are assembled.

Pudovkin's well-known "Film Technique" describes how Kuleshov—first headmaster of the Union School of Cinematography—took a single shot of an actor gazing pathetically off the screen. This he printed in triplicate, splicing the first copy adjacent to a shot of food, the second adjacent to one of a dead man, and the third adjacent to a further shot of a

woman. In the first case the actor looked hungry; in the second he looked bewildered—whilst in the third he looked sentimental.

Amateurs can definitely employ their own single scenes to establish different moods or emotional reactions in this way. Yet there is a great deal more in editing than this. It is necessary also to cut each shot to its most effective length; and it is necessary to introduce certain shots three or four times, often cutting the strips to a different length each time.

This is admittedly a difficult job, but it is one which comes easier with increasing experience. Eisenstein, master cutter that he is, performs many practical experiments before finally deciding upon an editing scheme. Which is the great secret of cinematography. No amount of reading will make anyone proficient; but reading coupled with the utmost possible practical work will enable every serious worker to cope well and truly with such subjects as we have had under discussion.

## Concentrate on Colour Films By M. A. LOVELL-BURGESS.

The time has certainly arrived when the more advanced amateur cinematographers, at any rate, will have to give serious consideration to the question of colour films. Here are some suggestions which should help them.

WHILE technicians are making further study of colour effects on the sound track, the emotional and the pictorial effect of colour in films need to be studied. And who are better fitted for that study than ciné amateurs, who normally bring to their hobby a wide cinematic experience?

One of the delights of being an amateur is that you are a free-lance, able to tilt your lance at will. And the time has come for ciné amateurs to approach the study of films in colour.

There is room for experiment, aesthetically and technically. Ciné amateurs could do little experimenting with talking films, because of almost prohibitive expense. But that restriction does not apply to colour films.

I suggest to secretaries of ciné clubs that they should make a place in the autumn session for discussions on "Colour Films" based on the following questions: What is the place of colour in films? Has colour in itself dramatic value or emotional content? Should artists collaborate with producers in making colour films? Should the use of colour be controlled? Will there be colour montage? How will colour affect cutting? Can movement in a colour film be harmoniously related to compositional effect?

Ciné amateurs have more leisure for experiment than the majority of film executives. It is possible the "findings"

of ciné amateurs on the colour question would prove of use to professionals.

The six main colour systems now being discussed by British film-producing companies are Technicolor—the three-colour process used in "Becky Sharp"; Hillman (known as Colourgrave), Spicer-Dufay—already used successfully by many amateurs; Keller-Dorian, Raycol, and Kodachrome, which has given excellent results on sub-standard film.

The hard pinks and greens and the diffusion of the earlier two-colour processes have gone, together with the fringing of unwanted colours and the fading and clogging. But the reason why professionals are so slow to use colour is that they realise that, like sound, it involves a new technique.

Colour, like a musical accompaniment, can be inspiring or merely irritating. When talking films arrived sound was used merely for its own novel sake. Film producers, where their use of sound was concerned, were rather like babies making loud noises for the sheer thrill of making them. Gradually, however, it was realised that sound needed to be subordinated to the story. The other day I saw a colour film in which, at a tense moment of mental conflict between two people, someone in the background in a red dress was bobbing about, and, against my will, attracting my attention. That sort of thing will have to be eliminated. Colour must be controlled.

Has colour any emotional content of its own? Some people are, perhaps, more sensitive to colour influence than are others. Yet to most people, red suggests war, trumpets, danger and pageantry, while blue is linked up with exaltation, peace, serenity, culminating, in many people, in a sense of worship. (In the B.B.C. Chapel a panel of blue light is used to promote a devotional atmosphere while the service is "on.") It would be interesting to know, by the way, whether these colour influences are the result of association or are inherent in the colours themselves.

With colour we have a new language to learn. It would help us to study all the colour films we can, including that very fine series of shorts, collectively entitled "Musical Moods," which are the first films to be made out of doors in Technicolor. Old-fashioned oil paintings could teach us a lot with regard to the dramatic use of colour. Best of all, we can experiment with colour filming ourselves.

Certain subjects demand black and white just as certain dramatic moments in a talking film demand silence. And always colour must accentuate rather than assert.

In "Becky Sharp"—screen version of Thackeray's "Vanity Fair"—the opening sequences are in pale colours, the hues deepening as the drama develops, so that colour is used like music, gathering in force to a fiery crescendo.

# Readers' Questions ANSWERED

**GENERAL.**—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

**CONTRIBUTIONS.**—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

**ENQUIRIES AND CRITICISM.**—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

## Competition Print.

Would the enclosed print be suitable for your Beginners' Competition? C. W. W. (London.)

With regard to the print you send, this is of nice quality, and the subject itself is of some interest. Such prints, however, do not stand any real chance in our Beginners' Competition, in which not only good technical quality is expected, but some special evidence of choice and arrangement of subject, which must have some pictorial merits as well. If you study the few beginners' prints reproduced each week you will see that some of them reach a pretty high pictorial level, though these have not been chosen for their special merits, but simply to illustrate various points.

## Tank Development.

Is the tank method of development for roll film satisfactory? I use a meter, but will not differences of exposure result in different densities? If my wife makes exposures without a meter will this not mean a still wider variation in exposure? V. P. W. (Cricklewood.)

When film is developed in the strip differences in exposure will naturally cause differences in the resulting negatives, but, within reasonably wide limits, this is immaterial, and you will get on the whole a better average of negatives than you might expect. If when your wife uses the camera she gives haphazard exposures, some of which will be markedly incorrect, no method of development will properly compensate for this.

## Prints for Competition.

Should prints for newspaper competitions be on glossy black-and-white paper, or suitably toned on suitable paper? W. D. (Lindfield.)

We are not in a position to explain the preferences of other editors, but in the cases you mention we should say that you would be safe in submitting glossy black-and-white prints. In any case, the subject in far more important than the paper.

## Sunset Exposures.

Using panchromatic film and a Gamma filter, what stop and exposure are necessary for photographing a sunset? L. J. E. (Ilford.)

It is quite impossible to state one definite exposure for photographing sunsets. At a certain stage the exposure may vary almost from minute to minute and your only course is to use an exposure meter. You can use a large stop, as probably everything included will be at a great distance. If you want to show details of landscape as well, this will affect the exposure.

## A First Negative.

This is the first negative I have ever developed; what is wrong, that it has turned out like this? W. J. S. (Newport.)

The negative you send is quite a good one, but for some reason or other you have used a paper base instead of the ordinary celluloid, and this means that you cannot make a print in the usual way. Prints and enlargements from such negatives are supposed to be done by professional firms.

## Shut-out for Dark-room.

I have made a frame to fit tightly in a window to make the room "dark," and over the frame I pasted two thicknesses of brown paper. This answered all right till holes got torn in it. Can you suggest a more durable substitute? G. L. (Rotherham.)

Some use thin plywood. Although it makes the frame rather heavy a piece of linoleum answers very well.

## Self-capping Shutter.

Is there any particular advantage in a self-capping focal-plane shutter as compared with the older type? M. J. (Lynn.)

The advantage of such a shutter is that it can safely be wound (set) while the shutter of the dark-slide or pack adapter is withdrawn. In such circumstances the winding of the older type of shutter would, of course, fog the plate or film. With reasonable care, however, the risk is not great.

## Amateur Status.

If I win a money prize in a newspaper competition should I remain an amateur, or should I be debarred from your competitions or from becoming a member of the R.P.S. or its affiliated clubs? R. C. (Cricklewood.)

If you win a prize in a newspaper photographic competition it will certainly not affect your standing as an amateur, and you will still be at liberty to enter our monthly competitions, except the Beginners' section. As to membership of the R.P.S. or its affiliated clubs, membership is open to professionals as well as amateurs.

## Simple Intensifier.

Is it possible to prepare any simple solution that will directly intensify a negative in one operation? O. M. (Cork.)

An old and tried formula was:

Mercuric chloride	..	..	54 grs.
Potassium iodide	..	..	65 grs.
Sodium sulphite	..	..	4 oz.
Water to	..	..	20 oz.

Dissolve the iodide in part of the water, add the mercury, stirring or shaking well, and finally add the sulphite previously dissolved in another amount of water. Most modern photographers are inclined to avoid the use of mercury for any purpose.

## Blue Toning.

Can you suggest a really reliable method of toning bromide prints to a good blue? N. L. G. (Swindon.)

Make up 10 per cent solutions of A, ferric ammonium citrate, B, potassium ferricyanide, C, acetic acid. Prepare a working solution of A 1 oz., B 1 oz., C 10 oz. The well washed print is immersed in this till the desired blue is obtained, and then washed till the high-lights are clear. The image is intensified by the process, and allowance must be made for this. We might suggest that you would be well advised to obtain blue prints from the original bromide by the Carbro process, which will give better and more reliable results.

## Bichromate Sensitiser.

When using potassium bichromate for sensitising carbon tissue, and paper for oil printing, I use equal parts of water and methylated spirit. The latter, however, precipitates the bichromate. This does not seem to affect the sensitising, but is there any way of avoiding it? F. P. (Luton.)

You cannot avoid it with the potassium salt, but it does not occur if you use, instead, ammonium bichromate, which has the further advantage that it dissolves more readily.

## Seconds Pendulum.

What must be the length of a pendulum to swing once per second? Can any other length be used for shutter testing? E. G. (Highgate.)

The length required is 39.1 in.—or a metre. Any other length can be used, but it might not be possible to ascertain the exact period of the swing, nor would it be so easy to measure the results.

## Stop Values.

I have just acquired a Goerz lens—a pretty old one I fancy—with the stops marked 4.8, 6, 12, 24, 48, 96, and 192. These seem to be f/ numbers; are they? E. L. M. (London.)

The stops are calculated on the Stolze system, and the corresponding f/ numbers are 6.8, 7.7, 11, 16, 22, 32 and 44.

# The AMATEUR'S EMPORIUM

## Business Notices

### Publishing

**OFFICES.**—Dorset House, Stamford Street, London, S.E.1. Telegrams: "Amaphot, Sedist, London." Telephone: Hop 3333 (50 lines).  
**PUBLISHING DATE.**—"The Amateur Photographer and Cinematographer" is on sale throughout the United Kingdom every Wednesday morning.  
**SUBSCRIPTION RATES.**—British Isles 17 4 per annum, Canada 17 4, other countries abroad 19 6 per annum, post free.  
**REMITTANCES.**—Cheques, etc., should be crossed and made payable to Iliffe and Sons Ltd. "The Amateur Photographer" can be obtained abroad from the following: **UNITED STATES:** The International News Co., New York. **FRANCE:** W. H. Smith & Son, 248, Rue Rivoli, Paris; Hachette et Cie, Rue Reaumur, Paris. **BELGIUM:** W. H. Smith & Son, 71-75, Boulevard Adolphe Max, Brussels. **AUSTRALIA:** Gordon & Gotch, Ltd., Melbourne (Victoria), Sydney (N.S.W.), Brisbane (Queensland), Adelaide (S.A.), Perth (W.A.), and Launceston (Tasmania). **NEW ZEALAND:** Gordon & Gotch, Ltd., Wellington, Auckland, Christchurch and Dunedin. **INDIA:** A. H. Wheeler & Co., Bombay, Allahabad and Calcutta. **CANADA:** Imperial News Co., Toronto, Winnipeg and Vancouver. **Benjamin News Co.,** Montreal; **Gordon & Gotch, Ltd.,** Toronto. **SOUTH AFRICA:** Central News Agency, Ltd.

### Displayed Advertisements

Communications on Advertisement matters should be addressed: The Advertisement Manager, "The Amateur Photographer and Cinematographer," Dorset House, Stamford Street, London, S.E.1. Copy for displayed advertisements for the issue of any particular week must reach Dorset House by the first post on Tuesday morning in the week previous. Rates and conditions will be sent upon application.

### Prepaid Advertisements

#### SALE AND EXCHANGE: AMATEURS ONLY—

12 words or less ..... 1/-

1d. for every additional word.

#### PROFESSIONAL AND TRADE:—

12 words or less ..... 2/6

2d. for every additional word.

Each paragraph is charged separately.

**SERIES DISCOUNTS** are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid and posted to arrive at the Head Office, Dorset House, Stamford Street, S.E.1, not later than first post FRIDAY for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 23b, Renfield Street, Glasgow, C.2.

Advertisements are inserted, as far as possible, in the order received, and those received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders sent in payment for Advertisements should be made payable to **ILIFFE AND SONS LTD.**, and crossed

& Co.

Notes being untraceable if lost in transit, should not be sent as remittances.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

**BOX NUMBERS.**—For the convenience of advertisers, letters may be addressed to numbers at the office of this paper. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charges, which must include the words: "Box 000, c/o 'The Amateur Photographer,'" Replies should be addressed: "Box 000, c/o 'The Amateur Photographer,' Dorset House, Stamford Street, London, S.E.1," and these letters will be simply forwarded by us to the advertiser. It must be understood that we do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisement. Readers who reply to Box No. advertisements are warned against sending remittances through the post except in registered envelopes. In all such cases the use of the "Deposit System" is recommended.

### Special Note

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

### Deposit System

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Amateur Photographer and Cinematographer," both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10 a deposit fee of 1/- is charged; on transactions over £10 and under £50 the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, one-half per cent. All deposit matters are dealt with at Dorset House, Stamford Street, London, S.E.1, and cheques and money orders should be made payable to Iliffe and Sons Ltd.

## WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

## CAMERAS AND LENSES

**B**ARGAIN.—3½×2½ Ernemann Press Camera, f/4.5 Ernostar, 3 D.D. slides, F.P.A. and roll-film adapter, 2 yellow filters, all in leather case; condition as new, £6.—Box 4982, c/o "The Amateur Photographer." [8851]

THE  
"Leudi"  
EXPOSURE  
METER  
PRICE ONLY  
**5/-**

Purse Case, 1/- extra.

Less than half the size of an ordinary pocket lighter the LEUDI is easily the smallest and neatest exposure meter made. As simple as it is small, and as efficient as it is simple, it is the finest value in exposure meters that you can possibly obtain. It is as effective indoors as out of doors, and can be used with plates or films of any make.

Ask your dealer to show you a "Leudi."

chester, 4. Phone, Collyhurst 2980. Closed  
7 p.m. [0092]

The best  
Photo  
Corners!

## "TRANSPAROL"

are made of pure "Cellophane" (Reg. Trade Mark),  
and not cheap imitation material. They are  
invisible, and show the picture up to its extreme  
edges. 6d. per box of 100.

They do not stick together and ruin  
the snaps like those of inferior makes.

## "FAVORIT"

are handsome opaque corners, easily and quickly  
fixed in position. Very ingenious—they make  
snapshot albums very beautiful—and eliminate the  
bugbear of messy paste pot and brush. Made in  
Sepia, Grey and Black. 6d. per box of 100.

## FROM YOUR DEALER

**FILMS** Developed and Printed, 3½ x 2½ 10d., post free; Prints 1d.; Postcards 2d.—Downing, 6, Brasenose Rd., Bootle, Liverpool. [6246]

## NON-FLEX SHUTTER RELEASE

The position of the release on shutters fitted to many hand cameras is inconvenient when using the camera at eye-level. The Non-Flex Shutter Release permits of the shutter being released by the forefinger when the camera is held at eye-level, thus ensuring steadiness and obviating the danger of moving the camera.

PRICE 1/6

For all cameras with between-lens shutters.

PLEASE MENTION "THE AMATEUR PHOTOGRAPHER" WHEN CORRESPONDING WITH ADVERTISERS.

## **FAST AMONG THE FASTEST...**

Even man's swift chariot of the sky is brought to a complete "standstill" by the amazing speed of Selochrome Roll Film.

Quicker than thought, Selochrome "sees" and seizes the picture, and—dull weather or bright—reproduces it with all faithfulness and truth.

*Let's talk about*

No. 3 of an explanatory series describing the finest all-purpose film in the world

## SUPERFINE GRAIN

'Panatomic' Film has a grain of microscopical fineness—very much finer than anything hitherto obtainable in roll films of such high speed.

Big enlargements from 'Panatomic' negatives show no falling off in clearness of tone and texture.

'Panatomic' is pre-eminently the film for miniature cameras—35 mm. and others. It is also made in all standard roll film and film pack sizes.

# A NEW MAGNIFIER

## For RUBYETTE CAMERAS

LARGE SINGLE LENS IN EBONIZED MOUNT. GIVES  
LARGE MAGNIFIED IMAGE WITHOUT EYE STRAIN

Makes Focussing Easy. Clips on to Rubyette Hood.

PRICE, IN VELVET-LINED CASE  
State if required for No. 1 or No. 2 model

**15/-**

## T.-P. COMPOUND MAGNIFIERS

### FOR STANDARD REFLEXES.

Are optically paired to  
give a single image.

PRICE, COMPLETE IN CASE,

**21/-**

### T.-P. PATENT TWELVE EXPOSURE ATTACHMENT

Fitted to the Rollex Roll-holder,  
the attachment allows twelve  
2½ in. square pictures to be  
taken on any standard eight 3½  
× 2½ exposure spool and does  
not prevent the roll-holder from  
being used for the normal eight  
3½ × 2½ exposures when desired.

Fitted to Rollex Roll-holder,  
from 30/-  
Fitted to customer's Roll-holder,  
17/6 (plus post).

# THORNTON-PICKARD

ALTRINCHAM, 7

ENGLAND

### THE STEVENS' PATENT SCREEN

This accessory has proved very popular since  
its introduction. It gives greater illumination

when focussing, thus  
allowing the com-  
posing of the picture  
to be carried out  
with an ease which  
should make it an  
indispensable part of  
every T.-P. Reflex  
user's outfit. Can  
be fitted to all T.-P.  
Reflex cameras, in  
3½ × 2½, ¼-pl. and P.C.  
sizes.

Fitted to "Rubyette"  
models . . 21/- extra.

OVER 30 YEARS' EXPERIENCE PROVES

# "Rolleicord"

THE BEST—Read this unsolicited testimonial:

Shirley, Grove Lane, Hale, Cheshire.

22nd June, 1935.

"I have been a keen amateur for over thirty years, both at home and in the East, and have possessed or used every type and make of camera at one time or another, but the Rolleicord is absolutely the finest camera I have handled.

"Since I bought the camera in April I have taken 177 negatives, comprising all sorts of subjects, under all lighting conditions, with and without Proxar lenses, and every single exposure has been needle sharp and in every way a delight.

"I have used reflex cameras, with and without magnifiers, but I have never used any camera with more confidence of obtaining dead accurate focus and a certainty of a real 'picture' on every negative.

"It is a delight to handle, precision built and beautifully finished.

"I am so enthusiastic over the camera that, although I hate writing letters, I feel it is only due to you to know how satisfied I am.

"I have sent some of the best of my pictures in for the competition and now that the closing date has been extended I shall send others.

"I like the square 'format' immensely."

Yours faithfully,

(Signed) ROYD BURNE.
